

# AT&T AT Commands Guide for the M14A2A LTE Module

# Contents

<b>Contents .....</b>	<b>2</b>
<b>1. Introduction .....</b>	<b>9</b>
1.1. Purpose and Scope .....	9
1.2. Definitions and Abbreviations .....	9
1.3. AT Command Availability .....	10
<b>2. Configuration Commands .....</b>	<b>11</b>
2.1. AT&F Reset AT Command Settings to Factory Default Values .....	11
2.2. AT&V Display Current Configuration .....	12
2.3. ATQ Result Code Presentation Mode .....	13
2.4. ATV Result Code Format Mode .....	14
2.5. ATX CONNECT Result Code Format .....	15
2.6. ATZ Restore AT Command Settings from a User Defined Profile .....	16
2.7. AT+CMEE Error Message Format .....	17
2.8. AT+CSGS Character Set .....	19
2.9. AT+CFUN Functionality Level .....	21
2.10. AT+GCAP Capabilities List .....	23
2.11. AT\$QCPWRDN Powering Down The UE .....	24
<b>3. Status Control Commands .....</b>	<b>25</b>
3.1. AT+CEER Extended Error Report .....	25
3.2. AT+CPAS Activity Status .....	26

3.3.	AT+WS46 Select Wireless Network .....	28
3.4.	AT%STATUS Query Module Status.....	29
<b>4.</b>	<b>Serial Interface Control Commands.....</b>	<b>32</b>
4.1.	AT&C Set Data Carrier Detect (DCD) Line Mode .....	32
4.2.	AT&D Set Data Terminal Ready (DTR) Line Mode .....	32
4.3.	AT&S Set Data Set Ready (DSR) Line Mode.....	33
4.4.	ATE AT Command Echo.....	34
4.5.	AT+IPR Bit Rate .....	35
<b>5.</b>	<b>Security Commands.....</b>	<b>37</b>
5.1.	AT+CPIN PIN Authentication .....	37
5.2.	AT+CLCK Facility Lock .....	39
5.3.	AT+CPWD Change Password .....	42
5.4.	AT+CPINR Display PIN Counter.....	44
<b>6.</b>	<b>Identification Commands .....</b>	<b>46</b>
6.1.	ATI Display Product Identification Information .....	46
6.2.	AT+CGMI Request Manufacturer Identification.....	47
6.3.	AT+GMI Request Manufacturer Identification .....	48
6.4.	AT+CGMM Request Model Identification .....	49
6.5.	AT+GMM Request Model Identification .....	50
6.6.	AT+CGMR Request Revision Identification of Software Status .....	51
6.7.	AT+GMR Request Revision Identification of Software Status .....	52
6.8.	AT+CGSN Request International Mobile Equipment Identity (IMEI).....	53
6.9.	AT+GSN Request International Mobile Equipment Identity (IMEI).....	54
6.10.	AT+CIMI Request International Mobile Subscriber Identity (IMSI).....	55

<b>7.</b>	<b>Network Service Commands.....</b>	<b>57</b>
7.1.	AT+COPN Read Operator Names.....	57
7.2.	AT+COPS Operator Selection.....	58
7.3.	AT+CPOL Preferred Operator List .....	62
7.4.	AT+CPLS Select Preferred Operator List .....	66
7.5.	AT+CREG Network Registration Status.....	68
7.6.	AT+CSQ Signal Quality.....	71
7.7.	AT\$QCSYSMODE Quesy Current System Mode of ME .....	72
7.8.	AT\$QCRSRP Display Neighbor Cell Information RSRP .....	73
7.9.	AT\$QCRSRQ Display Neighbor Cell Information RSRQ.....	74
<b>8.</b>	<b>Packet Domain Related Commands .....</b>	<b>76</b>
8.1.	AT+CGACT PDP Context Activate Or Deactivate.....	76
8.2.	AT+CGDATA Enter Date State .....	77
8.3.	AT+CGATT GPRS Attach Or Detach .....	80
8.4.	AT+CGDCONT Define PDP Context.....	81
8.5.	AT+CGEREP GPRS Event Reporting.....	85
8.6.	AT+CGREG Packet Domain Network Registration Status .....	87
8.7.	AT+CEREG Packet Domain Network Registration Status.....	89
8.8.	AT+CGCONTRDP PDP Context Read Dynamic Parameters.....	93
8.9.	AT+CGEQOS Define EPS Quality of Service .....	96
8.10.	AT+CGPADDR Show PDP Address.....	100
8.11.	ATD*99# Request Packet Domain service.....	102
8.12.	AT\$QCPDPP Set Type of Authentication for PDP-IP Connections.....	102
8.13.	AT%PDNSET Define PDP Context And Authentication .....	104

8.14.	AT\$QCRMCCALL Triggers an RmNet Call .....	106
8.15.	AT+CNMPSD No More PS data .....	108
8.16.	AT\$QCDNSP Sets Primary DNS IP Address .....	109
8.17.	AT\$QCDNSS Sets Secondary DNS IP Address .....	110
8.18.	AT\$QCDEFPROF Sets a Given Profile Number as a Default.....	111
8.19.	AT\$ECMCALL Triggers an ECM Call.....	112
8.20.	AT%PDNACT PDP Context Activate Or Deactivate .....	114
8.21.	AT%CMATT LTE network Attach Or Detach .....	116
<b>9.</b>	<b>USIM related Commands.....</b>	<b>119</b>
9.1.	AT+CRSM Restricted SIM Access .....	119
9.2.	AT+ICCID SIM Card Identification Number.....	120
9.3.	AT%CCID Reads the ICCID from SIM EFICCID .....	121
<b>10.</b>	<b>Internet Service Commands.....</b>	<b>123</b>
10.1.	AT@INTERNET Start Internet Service.....	123
10.2.	AT@DNSSEVR DNS Server Setting.....	124
10.3.	AT@DNSRESVDON Resolve Domain Name .....	125
10.4.	AT@SOCKDIAL Socket Dial-Up-Network .....	127
10.5.	AT@SOCKCREAT Socket Creation .....	128
<b>11.</b>	<b>AT@SOCKCREAT=&lt;protocol_type&gt;,&lt;ip_version&gt; .....</b>	<b>129</b>
<b>12.</b>	<b>@SOCKCREATE:(1-2),(0-1).....</b>	<b>129</b>
12.1.	AT@SOCKCONN Socket Connect.....	129
12.2.	AT@SOCKREAD Socket Read .....	130
12.3.	@SOCKDATAIND Notification for Data Received.....	132
12.4.	AT@SOCKWRITE Socket Write .....	133

12.5.	AT@SOCKRECV UDP Socket Data Receive.....	135
12.6.	AT@SOCKSEND UDP Socket Data Send.....	137
12.7.	AT@SOCKCLOSE Socket Close .....	138
12.8.	AT@SOCKERR Socket Error Code .....	138
12.9.	AT@FTPOPEN FTP Open.....	140
12.10.	AT@FTPCLOSE FTP Close.....	141
12.11.	AT@FTPGET FTP GET Operation .....	142
12.12.	AT@FTPGETDATA FTP GET data .....	143
12.13.	AT@FTPFILESIZE FTP Query File Size.....	145
12.14.	AT@FTPPUT FTP PUT Operation .....	145
12.15.	AT@ FTTPUTDATA FTP PUT data .....	146
12.16.	AT@FTPDEL FTP Delete File .....	148
12.17.	AT@PINGREQ Ping Request .....	149
<b>13.</b>	<b>Hardware Related Commands .....</b>	<b>152</b>
13.1.	AT@GPIOREQ Request to Control A GPIO.....	152
13.2.	AT@GPIOCFG Configure The Specific GPIO .....	153
13.3.	AT@GPIOGET Get The Logical State of The Specific GPIO .....	154
13.4.	AT@GPIOSET Set The Logical State of The Specific GPIO .....	155
13.5.	AT@THERMO Thermal Detection .....	157
13.6.	AT@ADCOP Analog-to-Digital Converter Operation .....	159
<b>14.</b>	<b>Miscellaneous Commands .....</b>	<b>161</b>
14.1.	@EXTERR Response of the Proprietary AT Command for Errors .....	161
14.2.	@FUNEWIND Indicator for New Firmware Notification .....	162
14.3.	@FUEXECIND Indication for Upgrade Availability.....	162

14.4. @FUDONEIND Indication that the Module's Firmware Upgrade Process is Complete.....	163
14.5. AT@FUSENDSTATE State of the Upgrading Process Sent to the Module... ...	164
14.6. AT@FURECVFILE Receive the Firmware File Using HEX.....	165
14.7. AT@HOSTINFO Send the Host's information to the Module .....	166
<b>15. Short Messages Service .....</b>	<b>167</b>
15.1 Introduction.....	167
15.2 Select message service +CSMS.....	168
15.3 Preferred message storage +CPMS.....	169
15.4 Preferred message format +CMGF.....	170
15.5 Save settings +CSAS.....	171
15.6 Restore settings +CRES.....	171
15.7 Show text mode parameters +CSDH.....	172
15.8 New message indication +CNMI.....	172
15.9 Incoming SMS/CBM indication via different AT interfaces +UDCONF=82.....	176
15.10 Select service for MO SMS messages +CGSMS.....	176
15.11 Read message +CMGR.....	177
15.12 New message acknowledgement to MT +CNMA.....	180
15.13 List message +CMGL.....	181
15.14 Send message +CMGS.....	183
15.15 Write message to memory +CMGW.....	184

15.16 Send message from storage +CMSS.....	185
15.17 Set text mode parameters +CSMP.....	186
15.18 Delete message +CMGD.....	187
15.19 Primary notification event reporting +CPNER.....	188
15.20 Service center address +CSCA.....	188
15.21 Select cell broadcast message types +CSCB.....	189
15.22 Read concatenated message +UCMGR.....	190
15.23 List concatenated message +UCMGL.....	193
15.24 Send concatenated message +UCMGS.....	195
15.25 Write concatenated message to memory +UCMGW.....	196
15.26 More messages to send +CMMS.....	197
15.27 Peek message +UCMGP.....	198
15.28 Message waiting indication +UMWI.....	199
<b>A      Supported Error Codes .....</b>	<b>201</b>
<b>B      Proprietary Error Codes .....</b>	<b>203</b>
<b>C      References .....</b>	<b>204</b>
<b>D      AT Commands Flow Examples.....</b>	<b>205</b>

# 1. Introduction

## 1.1. Purpose and Scope

This document provides information about the AT command set supported by the M18Q2 and M14A2.

The various AT commands are listed and associated with the M18Q2 and M14A2 Software Release.

The AT commands in this document are divided into the following sections:

1. Configuration Commands
2. Status Control Commands
3. Serial Interface Control Commands
4. Security Commands
5. Identification Commands
6. Network Service Commands
7. Packet Domain Related Commands
8. USIM related Commands
9. Internet Service Commands
10. Hardware Related Commands
11. Miscellaneous Commands

The error codes supported for the CMEE commands are provided for the software developer's reference.

**Note:**

For a detailed description of standard 3GPP AT commands, refer to specification (3GPP TS 27.007).

## 1.2. Definitions and Abbreviations

GSM	Global System for Mobile Communications
UMTS	Universal Mobile Telecommunications System
LTE	Long Term Evolution

<b>PLMN</b>	Public Land Mobile Network
<b>IMEI</b>	International Mobile Station Equipment Identity
<b>USIM</b>	Universal Subscriber Identity Module
<b>IMSI</b>	International Mobile Subscriber Identity

### 1.3. AT Command Availability

Some AT command or command parameters are not shared between all module products. The AT command availability will be indicated in each table in section 2 below. Regarding AT command parameters which are supported by certain special modules only, a note will be added to that parameter in the descriptions in this document.

## 2. Configuration Commands

### 2.1. AT&F Reset AT Command Settings to Factory Default

#### Values

##### AT&F parameter command syntax

Command	Possible response(s)
&F[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
Reference:	3GPP TS 27.007

##### Description:

TA sets all parameters to their defaults as specified by a user memory profile or by the manufacturer.

M14A2A will resets TA after command is executed successfully and field <value> is mandatory and need to be filled as 0.

##### Defined values:

<value>: integer

0 – Reset parameters; only a “0” value is available.

**Example:** Reset to default AT command settings

AT&F0

OK

## 2.2. AT&V Display Current Configuration

### AT&V parameter command syntax

Command	Possible response(s)
&V	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
Reference:	3GPP TS 27.007

### Description:

The AT command will return the setting of several AT command parameters applicable to the current operating mode.

### Defined values:

**Example:** Display of the current configurations for AT commands

```
AT&V
&C: 2; &D: 2; &E: 0; &F: 0; &S: 0; &W: 0; E: 1; L: 0; M: 0; Q: 0; V:
1;
X: 1; Z: 0; \Q: 3; \S: 0; \V: 0; O: 0; S0: 0; S2: 43; S3: 13; S4: 10;
S5: 8; S6: 2; S7: 0; S8: 2; S9: 6; S10: 14; S11: 95; S30: 0; S103: 1;
S104: 1; +FCLASS: 0; +ICF: 3,3; +IFC: 2,2; +IPR: 115200; +DR: 0;
+DS: 0,0,2048,6; +CMEE: 2; +WS46: 12; +CFUN:; +CBST: 0,0,1;
+CRLP: (61,61,48,6,0),(61,61,48,6,1),(240,240,52,6,2);
+CV120: 1,1,1,0,0,0; +CHSN: 0,0,0,0; +CSSN: 0,0; +CREG: 0; +CGREG: 0;
+CEREG: 0; +CSCS: "GSM"; +CSTA: 129; +CR: 0; +CRC: 0;
+CGDCONT:
```

```

(1,"IPV4V6","","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0");
+CGDSCONT: ; +CGTFT: ; +CGEQREQ: ; +CGEQMIN: ; +CGEQOS: ; +CGQREQ: ;
+CGQMIN: ; +CGEREP: 0,0; +CGDATA: "PPP"; +CGCLASS: "A"; +CGPIAF:
0,0,0,0;
+CGSMS: 1; +CSMS: 0; +CMGF: 0; +CSAS: 0; +CRES: 0; +CSCA: "",;
+CSMP: ,,0,0; +CSDH: 0; +CSCB: 0,"","",""; +ES: ,,,; +ESA: 0,,,0,0,255,;
+CMOD: 0; +CEMODE: 0; +CVHU: 1; ; ; ; ; ; +CPIN: , , ;
+CMEC: 0,0,0,0; +CIND: 0,0,0,0,0,0,0,0; +CMER: 0,0,0,0,0; +CGATT: 0;
; +CPBS: "ME"; +CPMS: "ME","ME","ME"; +CNMI: 0,0,0,0,0; +CMMS: 0;
+CCUG: 0,0,0; +COPS: 0,0,""; +CUSD: 0; +CAOC: 1; +CCWA: 0;
+CPOL: 0,2,"",0,0,0,0; +CPLS: 0; +CTZR: 0; +CTZU: 0; +CLIP: 0; +COLP:
0;
+CDIP: 0; +CLIR: 0; +CSDF: 1; +CEN: 0; *CNTI: 0; ^DSCI: 0; ^MODE: 0
OK

```

## 2.3. ATQ Result Code Presentation Mode

### ATQ parameter command syntax

Command	Possible response(s)
Q[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
Reference:	3GPP TS 27.007

### Description:

Result code suppression.

**Defined values:**

<value>: integer

0 – Enables result codes

1 – Disables result codes

**Example:**

Case 1: Enables returning of the result code “OK” to the host

```
ATQ0  
OK  
ATE  
OK
```

Case 2: Disables returning of the result code “OK” to the host

```
ATQ1
```

## 2.4. ATV Result Code Format Mode

**ATV parameter command syntax**

Command	Possible response(s)
V[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

DCE response format.

**Defined values:**

<value>: integer

0 – Displays result codes in numeric form

1 – Displays result codes in verbose form

**Example:**

Case 1: Enables returning of the result code “OK” to the host

```
ATV1  
OK  
ATE  
OK
```

Case 2: Enables returning of the result code “0” to the host

```
0TV0
```

## 2.5. ATX CONNECT Result Code Format

**ATX parameter command syntax**

Command	Possible response(s)
X[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

Result code selection and call progress monitoring control.

### Defined values:

<value>: integer

- 0 – Sends a CONNECT message when a connection is established by blind dialing; ignores dial tone and busy signals
- 1 – Enables additional result code CONNECT<rate>; disables dial tone and busy detection
- 2 – Enables additional result codes CONNECT <rate> and NO DIALTONE; disables busy detection; enables dial tone detection
- 3 – Enables additional result codes CONNECT <rate> and BUSY; enables busy detection; disables dial tone detection
- 4 – Enables additional result codes CONNECT <rate>, BUSY, and NO DIALTONE; enables busy and dial tone detection

**Example:** Enables additional result codes CONNECT <rate> and BUSY; enables busy detection; disables dial tone detection

```
ATX3
OK
ATD*99#
CONNECT 150000000
```

## 2.6. ATZ Restore AT Command Settings from a User Defined Profile

### ATZ parameter command syntax

Command	Possible response(s)
Z[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

TA sets all parameters to their defaults as specified by a user memory profile or by the manufacturer.

M14A2A will resets TA after command is executed successfully and not support optional field <value>.

**Defined values:**

<value><sup>[\*\*]</sup>: integer

0 – User Profile Number; only a “0” value is available.

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:** Only profile 0 is available for restoration, example for M18Q2.

```
ATZ0
OK
ATZ1
ERROR
```

## 2.7. AT+CMEE Error Message Format

**AT+CMEE parameter command syntax**

Command	Possible response(s)
+CMEE=[<n>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CMEE?	<i>Normally respond:</i> +CMEE:<n> OK

	<i>If something is wrong, then respond:</i> ERROR
+CMEE=?	<i>Normally respond:</i> +CMEE:(list of supported <n>) OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

### Description:

The set command disables or enables the use of result code +CME ERROR: <err> as an indication of an error relating to the functionality of the MT. When enabled, MT related errors cause a +CME ERROR: <err> final result code instead of the regular ERROR final result code. “ERROR” is returned normally when an error is related to syntax, invalid parameters, or TA functionality.

### Defined values:

<n>: integer

0 – Disable +CME ERROR: <err> result code and use ERROR

1 – Enable +CME ERROR: <err> result code and use numeric <err> values

2 – Enable +CME ERROR: <err> result code and use verbose <err> values

### Example:

Case 1: Enable +CME Error and use numeric form.

```
AT+CMEE=1
OK
AT+CPIN?
+CME ERROR: 10
```

Case 2: Enable +CME Error and use verbose form.

```
AT+CMEE=2
OK
AT+CPIN?
+CME ERROR: SIM not inserted
```

## 2.8. AT+CSCS Character Set

### AT+CSCS parameter command syntax

Command	Possible response(s)
+CSCS=[<chset>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CSCS?	<i>Normally respond:</i> +CSCS:<chset> OK  <i>If something is wrong, then respond:</i> ERROR
+CSCS=?	<i>Normally respond:</i> +CSCS:(list of supported <chset>s) OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

The set command informs TA which character set <chset> is used by the TE. TA is then able to convert character strings correctly between TE and MT character sets. When TA-TE interface is set to 8-bit operation and the TE alphabet to 7-bit operation, the highest bit shall be set to zero.

**Defined values:**

<chset>: character set as a string type (Conversion schemes not listed here can be defined by manufacturers.)

- "GSM"<sup>[\*\*]</sup> – GSM 7 bit default alphabet (3GPP TS 23.038); this setting easily causes software-flow control (XON/XOFF) problems.
- "IRA" – International reference alphabet
- "UCS2" – 16-bit universal multiple-octet coded character set (Refer to ISO/IEC10646 [32].); UCS2 character strings are converted to hexadecimal numbers from 0000 to FFFF; e.g. "004100620063" equals three 16-bit characters with decimal values 65, 98, and 99.
- "HEX"<sup>[\*]</sup> – Character strings consist only of hexadecimal numbers from 00 to FF; e.g. "032FE6" equals three 8-bit characters with decimal values 3, 47 and 230; no conversions to the original MT character set shall be done.
- "8859-1"<sup>[\*]</sup> – ISO 8859 Latin 1 character set
- "PCCP437"<sup>[\*]</sup> – PC character set Code Page 437

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:**

Case 1: Set coding scheme to GSM 7 bit default alphabet and query the settings.

```
AT+CSCS="GSM"
OK
AT+CSCS?
+CSCS: "GSM"

OK
```

Case 2: Query-supported coding schemes, setting an invalid value will return “ERROR”. The example is for M18Q2 only.

```
AT+CSCS=?
+CSCS: ("IRA", "GSM", "UCS2")
```

```
OK  
AT+CSCS="UTF8"  
ERROR
```

## 2.9. AT+CFUN Functionality Level

### AT+CFUN parameter command syntax

Command	Possible response(s)
+CFUN=[<fun>[,<rst>]]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CFUN?	<i>Normally respond:</i> +CFUN:<fun> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CFUN=?	<i>Normally respond:</i> +CFUN:(list of supported <fun>),(list of supported <rst>) OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
<b>Reference:</b>	3GPP TS 27.007

### Description:

The set command selects the level of functionality <fun> in the MT. The highest level of power drawn is at "full functionality". The minimum power is drawn at "minimum functionality". The level of functionality between these may also be specified by manufacturers. When supported by manufacturers, MT resetting with the <rst> parameter may be utilized. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

### Defined values:

<fun>: integer

- 0 – Minimum functionality
- 1 – Full functionality
- 4 – Disable phone both transmit and receive RF circuits
- 5<sup>[\*\*]</sup> – Factory Test Mode
- 6<sup>[\*\*]</sup> – Reset Mode
- 7<sup>[\*\*]</sup> – Offline Mode

<rst>: integer

- 0 – Do not reset the MT before setting it to <fun> power level
- 1 – Reset the MT before setting it to <fun> power level

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

### Example:

Case 1: Query the supported +CFUN values. The example is for M18Q2 only.

```
AT+CFUN=?  
+CFUN: (0-1,4-7),(0-1)  
  
OK
```

Case 2: Go to the airplane mode and then go back to normal mode.

```
AT+CFUN=0  
OK
```

```
AT+CFUN=1
```

```
OK
```

## 2.10. AT+GCAP Capabilities List

### AT+GCAP parameter command syntax

Command	Possible response(s)
+GCAP	<i>Normally respond:</i> +GCAP: <capability>s OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The AT command will request overall capabilities of TA.

#### Defined values:

<capability>: string, the capabilities of TA, ex: +CGSM, +CLTE1...etc.

**Example:** Request overall capabilities of TA

```
AT+GCAP
```

```
+GCAP: +CLTE1
```

```
OK
```

## 2.11. AT\$QCPWRDN Powering Down The UE

### AT\$QCPWRDN parameter command syntax

Command	Possible response(s)
\$QCPWRDN	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Qualcomm 80-VR432-1
<b>Note:</b>	Accepts no arguments

#### Description:

This command is used to power down the UE.

#### Defined values:

## 3. Status Control Commands

### 3.1. AT+CEER Extended Error Report

#### AT+CEER parameter command syntax

Command	Possible response(s)
+CEER	<i>Normally respond:</i> +CEER:<report> OK  <i>If something is wrong, then respond:</i> ERROR
+CEER=?	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
Reference:	3GPP TS 27.007

#### Description:

The execution command causes the TA to return one or more lines of information text <report>, determined by the MT manufacturer. This should offer the user of the TA an extended report of the reason for:

- the failure in the last unsuccessful call setup (originating or answering) or in-call modification
- the last call release
- the last unsuccessful GPRS attach or unsuccessful PDP context activation
- the last GPRS detach or PDP context deactivation

Typically, the text will consist of a single line containing the cause information given by the GSM/UMTS network in textual format.

**Defined values:**

<report>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,041 characters.

**Example:** Display CEER status

```
at+cgdcont?  
+CGDCONT:

## 3.2. AT+CPAS Activity Status

### AT+CPAS parameter command syntax

Command	Possible response(s)
+CPAS	<p><i>Normally respond:</i></p> <p>+CPAS:&lt;pas&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>

+CPAS=?	<i>Normally respond:</i> +CPAS:(list of supported <pas>s) OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The execution command returns the activity status <pas> of the MT. It can be used to interrogate the MT before requesting action from the phone. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

#### Defined values:

<pas>: integer

- 0 – Ready (MT allows commands from TA/TE.)
- 1 – Unavailable (MT does not allow commands from TA/TE.)
- 2 – Unknown (MT is not guaranteed to respond to instructions.)
- 3 – Ringing (MT is ready for commands from TA/TE, but the ringer is active.)
- 4 – Call in progress (MT is ready for commands from TA/TE, but a call is in progress.)
- 5 – Asleep (MT is unable to process commands from TA/TE because it is in a low functionality state.)

#### Example: Query CPAS status

```
at+cgdcont?
+CGDCONT:
1,"IPV4V6","TESTSIM","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0
OK
at+cgatt=1
OK
```

```
at+cpas
+CPAS: 4
OK
```

### 3.3. AT+WS46 Select Wireless Network

#### AT+WS46 parameter command syntax

Command	Possible response(s)
+WS46=<n> <sup>[*]</sup>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+WS46?	<i>Normally respond:</i> <n> OK  <i>If something is wrong, then respond:</i> ERROR
+WS46=?	<i>Normally respond:</i> (list of supported <n>s) OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

#### Description:

The AT command is intended for reading the current status of the network selection.

The M14A2A support only E-UTRAN. The modem returns E-UTRAN for the read and test command. The set command accepts only E-UTRAN.

**Defined values:**

<n>: integer

- 12<sup>[\*\*]</sup> – GSM Digital Cellular Systems (GERAN only)
- 22<sup>[\*\*]</sup> – UTRAN only
- 25<sup>[\*\*]</sup> – 3GPP Systems (GERAN, UTRAN and E-UTRAN)
- 28 – E-UTRAN only
- 29<sup>[\*\*]</sup> – GERAN and UTRAN

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:** Select wireless network for M14A2A.

```
AT+WS46?  
28  
OK  
AT+WS46=28  
OK  
AT+WS46=25  
ERROR  
AT+WS46=?  
(28)  
OK
```

### 3.4. AT%STATUS Query Module Status

#### AT%STATUS parameter command syntax

Command	Possible response(s)
%STATUS=<subsystem>	<i>Normally respond:</i> <subsystem>: <status>[,<status_info>] OK  <i>If something is wrong, then respond:</i> ERROR
%STATUS=?	<i>Normally respond:</i>

%STATUS: (list of supported <subsystem>s)

OK

*If something is wrong, then respond:*

ERROR

**Reference:**

Altair\_SW\_201\_AT\_Commands\_Guide\_Rev3.pdf

### Description:

The AT command is intended for retrieves current status of specified UE subsystem.

### Defined values:

<subsystem>: string

INIT – Module initial status

USIM – USIM type status

RRC – RRC status

ROAM – Roam status

UICC – UICC status

<status>: integer or string

For “INIT”: integer

0 – UE init process ongoing (calibration in progress)

1 – UE init process has finished (calibration complete)

2 – UE init process has finished (calibration complete) but with critical errors.

(SYS\_CRITICAL)

For “USIM”: string

“USIM: REAL USIM, LTE”

“USIM: REAL USIM, non-LTE”

“USIM: USIM SIMULATOR”

“USIM: NO USIM”

“USIM: REAL USIM DEACTIVATED”

“USIM: INVALID USIM”

"USIM: PERSONALIZATION ERROR"  
"USIM: REMOTE USIM"  
For "RRC": string  
    "RRC: IDLE"  
    "RRC: CONNECTED"  
    "RRC: UNKNOWN" – Used for all other states (init, standby, flight mode, etc.)  
For "ROAM":  
    0 – UE is not roaming (UE isn't camped at all or UE is camped on HPLMN/EHPLMN)  
    1 – UE is roaming and camped on VPLMN  
For "UICC":  
    0 – SIM is not inserted  
    1 – SIM inserted, init is in progress  
    2 – SIM init passed, wait for PIN unlock  
    3 – Personalization failed, wait for run-time depersonalization  
    4 – Activation completed. Reported when "Ready" state is reported by "AT+CPIN?"  
    5 – Activation completed. RAM cache also ready

**Example:** Query USIM/RRC/INIT status.

```
AT%STATUS="INIT"
INIT: 1
OK
AT%STATUS="RRC"
RRC: IDLE
OK
AT%STATUS="USIM"
USIM: REAL USIM, LTE, Activated 1 times, Verified 1 times
OK
AT%STATUS="UICC"
UICC: 5
OK
```

## 4. Serial Interface Control Commands

### 4.1. AT&C Set Data Carrier Detect (DCD) Line Mode

AT&C parameter command syntax

Command	Possible response(s)
AT&C[<value>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
Reference:	ITU-T Recommendation V.250

**Description:**

Circuit 109 DCE RLSD (DCD) behavior

**Defined values:**

<value>: integer

0 – Circuit 109 (CF) always ON

1 – Circuit 109 (CF) ON in accordance with the specified service

2 – Circuit 109 (CF) always on except a wink on channel disconnect

### 4.2. AT&D Set Data Terminal Ready (DTR) Line Mode

AT&D parameter command syntax

Command	Possible response(s)
AT&D[<value>]	<i>Normally respond:</i>

	OK
<i>If something is wrong, then respond:</i>	
	ERROR

**Reference:** ITU-T Recommendation V.250

**Description:**

AT&D determines how the ME responds if the DTR line is changed from and ON to OFF state during data connection. It's circuit 108 DTE DTR behavior.

**Defined values:**

<value>: integer

0 – Ignores circuit 108/2 (CD)

1 – Enters Online Command state following ON-to-OFF transition of circuit 108/2

2 – Enters Command state following ON-to-OFF transition of circuit 108/2

### 4.3. AT&S Set Data Set Ready (DSR) Line Mode

**AT&S parameter command syntax**

Command	Possible response(s)
AT&S[<value>]	<i>Normally respond:</i> OK
<i>If something is wrong, then respond:</i>	
	ERROR

**Reference:** ITU-T Recommendation V.250

**Description :**

AT&S determines how the ME sets the DSR line depending on its communication state. This command is not configurable. DSR control management Default – Always ON (&S0)

**Defined values:**

<value>: integer

0 – DSR line is always ON

1 – UE in command mode then DSR will be off; UE in data mode then DSR is on.

## 4.4. ATE AT Command Echo

**ATE parameter command syntax**

Command	Possible response(s)
E<value>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

The set command enables/disables the command echo.

**Defined values:**

<value>: integer

0 – Disables command echo

1 – Enables command echo (factory default); hence the commands sent to the device are echoed back to the DTE before the response is given.

**Note:** If this parameter is omitted, the command has the same behavior as ATE1. But M14A2A not support, the <value> has to be inputed as mandatory parameter.

**Example:** Turn on/turn off echo.

```
ATE0
OK
(AT) - not display
OK
(ATE1) - not display
OK
AT
OK
```

## 4.5. AT+IPR Bit Rate

### AT+IPR parameter command syntax

Command	Possible response(s)
+IPR=<rate>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+IPR?	<i>Normally respond:</i> +IPR:<rate> OK  <i>If something is wrong, then respond:</i> ERROR
+IPR=?	<i>Normally respond:</i> +IPR: (list of supported <rate>s) OK

*If something is wrong, then respond:*

ERROR

**Reference:** 3GPP TS 27.007

**Description:**

Fixed DTE rate; this numeric extended-format parameter specifies the data rate at which the DCE will accept commands; auto baud rate detection is not supported.

**Defined values:**

<rate >: integer, transmission rate, ex:115200

**Example:** Set rate by IPR

```
AT+IPR=115200
OK
AT+IPR?
+IPR: 115200
OK
```

# 5. Security Commands

## 5.1. AT+CPIN PIN Authentication

### AT+CPIN parameter command syntax

Command	Possible response(s)
+CPIN=<pin>[,<newpin>]	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+CPIN?	<p><i>Normally respond:</i></p> <p>+CPIN:&lt;code&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
<b>Reference:</b>	3GPP TS 27.007

### Description:

The set command sends a password to the MT which is necessary before its operation (such as SIM PIN, SIM PUK, or PH-SIM PIN). If the PIN is to be entered twice, the TA shall automatically repeat the PIN. If there is no pending PIN, no action will be performed towards MT, and an error message “+CME ERROR” is returned to TE. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

**Defined values:**

<pin>, <newpin>: string

<code> string, values reserved by the present document:

READY	– MT is not pending for any password.
SIM PIN	– MT is waiting for the SIM PIN to be given.
SIM PUK	– MT is waiting for the SIM PUK to be given.
PH-SIM PIN	– MT is waiting for the phone-to-SIM card password to be given.
PH-FSIM PIN	– MT is waiting for the phone-to-initial SIM-card password to be given.
PH-FSIM PUK	– MT is waiting for the phone-to-initial-SIM-card unblocking password to be given.
SIM PIN2	– MT is waiting for the SIM PIN2 to be given. This <code> is recommended to be returned only when the last executed command results in a PIN2 authentication failure (i.e. +CME ERROR: 17); if PIN2 is not entered immediately after the failure, it is recommended that MT does not block its operation.
SIM PUK2	– The MT is waiting for the SIM PUK2 to be given. This <code> is recommended to be returned only when the last executed command results in a PUK2 authentication failure (i.e. +CME ERROR: 18); if PUK2 and new PIN2 are not entered immediately after the failure, it is recommended that MT does not block its operation.
PH-NET PIN	– MT is waiting for the network personalization password to be given.
PH-NET PUK	– MT is waiting for the network personalization unblocking password to be given.
PH-NETSUB PIN	– MT is waiting for the network subset personalization password to be given.
PH-NETSUB PUK	– MT is waiting for the network subset personalization unblocking password to be given.
PH-SP PIN	– MT is waiting for the service provider personalization password to be given.
PH-SP PUK	– MT is waiting for the service provider personalization unblocking password to be given.
PH-CORP PIN	– MT is waiting for the corporate personalization password to be given.

PH-CORP PUK – MT is waiting for the corporate personalization unblocking password to be given.

**Example:** Query PIN status and enter PIN code

```
AT+CPIN?  
+CPIN: SIM PIN  
OK  
AT+CPIN="1234"  
OK  
AT+CPIN?  
+CPIN: READY  
OK
```

## 5.2. AT+CLCK Facility Lock

**AT+CLCK parameter command syntax**

Command	Possible response(s)
+CLCK=<fac>,<mode>[,<passwd>[,<class>]]	<p><i>Normally respond:</i></p> <p>OK</p> <p>when &lt;mode&gt;=2 and command successful:</p> <p>+CLCK:&lt;status&gt;[,&lt;class1&gt;</p> <p>[&lt;CR&gt;&lt;LF&gt;+CLCK:&lt;status&gt;,&lt;class2&gt;</p> <p>[...]]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+CLCK=?	<p><i>Normally respond:</i></p> <p>+CLCK:(list of supported &lt;fac&gt;s)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>

**Description:**

The execute command is used to lock, unlock, or interrogate an MT or a network facility <fac>. A password is normally required to perform such actions. When querying the status of a network service (<mode>=2), the response line for a “not active” case (<status>=0) should be returned only if service is not active for any <class>. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#). This command should be abortable when network facilities are set or interrogated.

Call-barring facilities are based on GSM/UMTS supplementary services. (Refer to 3GPP TS 22.088.) The interaction of these with other commands based on other GSM/UMTS supplementary services is described in the GSM/UMTS standard.

The test command returns facility values supported as a compound value.

**Defined values:**

<fac>: string, values reserved by the present document:

- "PS"<sup>[\*]</sup> – PH-SIM (lock PHone to SIM/UICC card) (MT requests a password when other-than-current SIM/UICC cards have been inserted; MT may have stored information regarding a certain number of previously used cards thus not requiring passwords when they are inserted.)
- "PF"<sup>[\*\*]</sup> – Locks the phone to the very first inserted SIM/UICC card (also referred to in the present document as PH-FSIM) (MT requests the password when SIM/UICC cards other than the first SIM/UICC card has been inserted.)
- "SC" – SIM (lock SIM/UICC card) (The SIM/UICC requests the password when the MT powers up and when this lock command has been issued.)
- "AO"<sup>[\*\*]</sup> – BAOC (Barr All Outgoing Calls) (Refer to 3GPP TS 22.088 clause 1.)
- "OI"<sup>[\*\*]</sup> – BOIC (Barr Outgoing International Calls) (Refer to 3GPP TS 22.088 clause 1.)
- "OX"<sup>[\*\*]</sup> – BOIC-exHC (Barr Outgoing International Calls except to the Home

- Country) (Refer to 3GPP TS 22.088 clause 1.)
- "AI"<sup>[\*\*]</sup> – BAIC (Barr All Incoming Calls) (Refer to 3GPP TS 22.088 clause 2.)
  - "IR"<sup>[\*\*]</sup> – BIC-Roam (Barr Incoming Calls when Roaming outside the home country) (Refer to 3GPP TS 22.088 clause 2.)
  - "AB"<sup>[\*\*]</sup> – all barring services (Refer to 3GPP TS 22.030.) (applicable only for <mode>=0)
  - "AG"<sup>[\*\*]</sup> – All outgoing barring services (Refer to 3GPP TS 22.030.) (applicable only for <mode>=0)
  - "AC"<sup>[\*\*]</sup> – All incoming barring services (Refer to 3GPP TS 22.030.) (applicable only for <mode>=0)
  - "FD"<sup>[\*\*]</sup> – SIM card or active application in the UICC (GSM or USIM) fixed dialing memory feature (If PIN2 authentication has not been performed during the current session, PIN2 is required as <passwd>.)
  - "PN" – Network Personalization (Refer to 3GPP TS 22.022.)
  - "PU" – network subset personalization (Refer to 3GPP TS 22.022.)
  - "PP" – service provider personalization (Refer to 3GPP TS 22.022.)
  - "PC" – corporate personalization (Refer to 3GPP TS 22.022.)

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

<mode>: integer

- 0 – unlock
- 1 – lock
- 2 – query status

<status>: integer

- 0 – not active
- 1 – active

<passwd>: string, shall be the same as the password specified for the facility from the MT user interface or with the command Change Password +CPWD

<classx>: integer, this is a sum of integers each representing a class of information (default 7 - voice, data and fax):

- 1 – voice (telephony)
- 2 – data (refers to all bearer services; with <mode>=2 this may refer only to some bearer service if TA does not support values 16, 32, 64, and 128.)
- 4 – fax (facsimile services)
- 8 – short message service

- 16 – data circuit sync
- 32 – data circuit async
- 64 – dedicated packet access
- 128 – dedicated PAD access

**Example:** Query and set PIN enable/disable status

```
AT+CLCK="SC",2
+CLCK: 0
OK
AT+CLCK="SC",1,"1234"
OK
AT+CLCK="SC",2
+CLCK: 1
OK
```

### 5.3. AT+CPWD Change Password

**AT+CPWD parameter command syntax**

Command	Possible response(s)
+CPWD=<fac>,<oldpwd>,<newpwd>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CPWD=?	<i>Normally respond:</i> +CPWD: list of supported (<fac>,<pwdlength>)s OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

Action command sets a new password for the facility lock function defined by the command Facility Lock +CLCK. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

The test command returns a list of pairs which present the available facilities and the maximum length of their password.

**Defined values:**

<fac>: string, values reserved by the present document:

- "P2" – SIM PIN2
- "PS"<sup>[\*]</sup> – PH-SIM (lock PPhone to SIM/UICC card) (MT requests a password when other-than-current SIM/UICC cards have been inserted; MT may have stored information regarding a certain number of previously used cards thus not requiring passwords when they are inserted.)
- "SC" – SIM (lock SIM/UICC card) (The SIM/UICC requests the password when the MT powers up and when this lock command has been issued.)
- "AO"<sup>[\*\*]</sup> – BAOC (Barr All Outgoing Calls) (Refer to 3GPP TS 22.088 clause 1.)
- "OI"<sup>[\*\*]</sup> – BOIC (Barr Outgoing International Calls) (Refer to 3GPP TS 22.088 clause 1.)
- "OX"<sup>[\*\*]</sup> – BOIC-exHC (Barr Outgoing International Calls except to the Home Country) (Refer to 3GPP TS 22.088 clause 1.)
- "AI"<sup>[\*\*]</sup> – BAIC (Barr All Incoming Calls) (Refer to 3GPP TS 22.088 clause 2.)
- "IR"<sup>[\*\*]</sup> – BIC-Roam (Barr Incoming Calls when Roaming outside the home country) (Refer to 3GPP TS 22.088 clause 2.)
- "AB"<sup>[\*\*]</sup> – all barring services (Refer to 3GPP TS 22.030.) (Applicable only for <mode>=0.)
- "AG"<sup>[\*\*]</sup> – All outgoing barring services (Refer to 3GPP TS 22.030.) (Applicable only for <mode>=0.)
- "AC"<sup>[\*\*]</sup> – All incoming barring services (Refer to 3GPP TS 22.030.) (Applicable only for <mode>=0.)
- "PN"<sup>[\*]</sup> – Network Personalization (Refer to 3GPP TS 22.022.)

- "PU"<sup>[\*]</sup> – network subset personalization (Refer to 3GPP TS 22.022.)
- "PP"<sup>[\*]</sup> – service provider personalization (Refer to 3GPP TS 22.022.)
- "PC"<sup>[\*]</sup> – corporate personalization (Refer to 3GPP TS 22.022.)

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

<oldpwd>, <newpwd>: string type, <oldpwd> shall be identical to the password specified for the facility from the MT user interface or with command Change Password +CPWD; <newpwd> is the new password. The maximum length of the password can be determined with <pwdlength>.

**Example:** Enable PIN and change PIN code

```
AT+CPIN?
+CPIN: SIM PIN
OK
AT+CPIN="0000"
OK
AT+CPIN?
+CPIN: READY
OK
AT+CPWD="SC", "0000", "1234"
OK
```

## 5.4. AT+CPINR Display PIN Counter

### AT+CPINR parameter command syntax

Command	Possible response(s)
+CPINR[=<sel_code>]	<p><i>Normally respond:</i></p> <p>+CPINR:&lt;code&gt;,&lt;retries&gt;[,&lt;default_retries&gt;]  [&lt;CR&gt;&lt;LF&gt;+CPINR:&lt;code&gt;,&lt;retries&gt;[,&lt;default_retries&gt;]  [...]]  OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CPINR=?	<p><i>Normally respond:</i></p> <p>OK</p>

*If something is wrong, then respond:*

ERROR

**Reference:** 3GPP TS 27.007

**Description:**

Execution command cause the MT to return the number of remaining PIN retries for the MT passwords with intermediate result code +CPINR: <code>,<retries>[,<default\_retries>] for standard PINs.

**Defined values:**

<retries>: integer, number of remaining retries per PIN.

<default\_retries>: integer, number of default/initial retries per PIN.

<sel\_code><code>: string

- "SIM PIN" – SIM PIN code
- "SIM PUK" – SIM PUK code
- "SIM PIN2" – SIM PIN2 code
- "SIM PUK2" – SIM PUK2 code
- "PH-NET PIN" – Network Personalization code
- "PH-SIM PIN" – PH-SIM lock code

**Example:** Query remain retries for all PINs

```
AT+CPINR
+CPINR: SIM PIN, 3, 3
+CPINR: SIM PUK, 10, 10
+CPINR: SIM PIN2, 3, 3
+CPINR: SIM PUK2, 10, 10
+CPINR: PH-NET PIN, 3, 3
+CPINR: PH-SIM PIN, 3, 3
OK
```

## 6. Identification Commands

### 6.1. ATI Display Product Identification Information

#### ATI parameter command syntax

Command	Possible response(s)
ATI	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> ERROR

#### Reference:

#### Description:

Display Product Identification Information

#### Defined values:

#### Example:

```
ATI
Manufacturer: WNC
Model: M18Q2
Revision: MPSS: M18Q2_v12.04.162021 APSS: M18Q2_v00.07.162132
CUSTAPP:
SVN: 01
IMEI: 004402330002308
+GCAP: +CGSM
OK
```

## 6.2. AT+CGMI Request Manufacturer Identification

### AT+CGMI parameter command syntax

Command	Possible response(s)
+CGMI	<p><i>Normally respond:</i></p> <p>&lt;manufacturer&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CGMI=?	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
<b>Reference:</b>	3GPP TS 27.007

### Description:

The execution command causes the TA to return one or more lines of information text <manufacturer>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the manufacturer of the MT to which it is connected. Typically, the text will consist of a single line containing the name of the manufacturer, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

### Defined values:

<manufacturer>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters. Text shall not contain the sequence 0<CR> or OK<CR>.

### Example:

```
AT+CGMI  
WNC  
OK
```

## 6.3. AT+GMI Request Manufacturer Identification

### AT+GMI parameter command syntax

Command	Possible response(s)
+GMI	<i>Normally respond:</i> <manufacturer> OK  <i>If something is wrong, then respond:</i> ERROR
+GMI=?	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	ITU-T V.25ter

### Description:

The execution command causes the TA to return one or more lines of information text <manufacturer>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the manufacturer of the MT to which it is connected. Typically, the text will consist of a single line containing the name of the manufacturer, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

### Defined values:

<manufacturer>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters. Text shall not contain the sequence 0<CR> or OK<CR>.

## 6.4. AT+CGMM Request Model Identification

### AT+CGMM parameter command syntax

Command	Possible response(s)
+CGMM	<i>Normally respond:</i> <model> OK  <i>If something is wrong, then respond:</i> ERROR
+CGMM=?	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

### Description:

The execution command causes the TA to return one or more lines of information text <model>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the specific model of the MT to which it is connected. Typically, the text will consist of a single line containing the name of the product, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

### Defined values:

<model>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters.

**Example:**

```
AT+CGMM  
M18Q2  
OK
```

## 6.5. AT+GMM Request Model Identification

### AT+GMM parameter command syntax

Command	Possible response(s)
+GMM	<i>Normally respond:</i> <model> OK
	<i>If something is wrong, then respond:</i> ERROR
+GMM=?	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	ITU-T V.25ter

**Description:**

The execution command causes the TA to return one or more lines of information text <model>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the specific model of the MT to which it is connected. Typically, the text will consist of a single line containing the name of the product, but manufacturers may choose

to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

**Defined values:**

<model>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters.

## 6.6. AT+CGMR Request Revision Identification of Software

### Status

#### AT+CGMR parameter command syntax

Command	Possible response(s)
+CGMR	<i>Normally respond:</i> <revision> OK  <i>If something is wrong, then respond:</i> ERROR
+CGMR=?	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

The execution command causes the TA to return one or more lines of information text <revision>, determined by the MT manufacturer, which is intended to permit the user of

the TA to identify the version, revision level or date, or other pertinent information of the MT to which it is connected. Typically, the text will consist of a single line containing the version of the product, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

**Defined values:**

<revision>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters.

**Example:**

```
AT+CGMR
MPSS: M18Q2_v12.04.162021 APSS: M18Q2_v00.07.162132 CUSTAPP:
OK
```

## 6.7. AT+GMR Request Revision Identification of Software

### Status

#### AT+GMR parameter command syntax

Command	Possible response(s)
+GMR	<i>Normally respond:</i> <revision> OK  <i>If something is wrong, then respond:</i> ERROR
+GMR=?	<i>Normally respond:</i> <revision> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	ITU-T V.25ter

**Description:**

The execution command causes the TA to return one or more lines of information text <revision>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the version, revision level or date, or other pertinent information of the MT to which it is connected. Typically, the text will consist of a single line containing the version of the product, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

**Defined values:**

<revision>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters.

## 6.8. AT+CGSN Request International Mobile Equipment

### Identity (IMEI)

**AT+CGSN parameter command syntax**

Command	Possible response(s)
+CGSN	<p><i>Normally respond:</i></p> <p>&lt;sn&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERRORor</p> <p>+CME ERROR: &lt;err&gt;</p>
+CGSN=?	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p>

ERROR

**Reference:** 3GPP TS 27.007

**Description:**

The execution command causes the TA to return one or more lines of information text <sn>, determined by the MT manufacturer, which is intended to permit the user of the TA to identify the individual MT to which it is connected. Typically, the text will consist of a single line containing the IMEI (International Mobile station Equipment Identity; refer to 3GPP TS 23.003.) number of the MT, but manufacturers may choose to provide more information if desired. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

**Defined values:**

<sn>: string, the total number of characters, including line terminators, in the information text shall not exceed 2,048 characters.

**Example:**

AT+CGSN

004402330002308

OK

## 6.9. AT+GSN Request International Mobile Equipment

### Identity (IMEI)

#### AT+GSN parameter command syntax

Command	Possible response(s)
AT+GSN	<i>Normally respond:</i> <sn> OK

	<i>If something is wrong, then respond:</i> ERROR or +CME ERROR: <err>
<b>AT+GSN=?</b>	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> ERROR

#### Description:

AT+GSN delivers the International Mobile Equipment Identity (IMEI). The command is identical to AT+CGSN.

#### Defined values:

<SN>: string, International Mobile Equipment Identity (IMEI) used to identify a GSM mobile equipment to the GSM network.

## 6.10. AT+CIMI Request International Mobile Subscriber

### Identity (IMSI)

#### AT+CIMI parameter command syntax

Command	Possible response(s)
+CIMI	<i>Normally respond:</i> <IMSI> OK

	<i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CIMI=?	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> ERROR

**Reference:** 3GPP TS 27.007

#### Description:

The execution command causes the TA to return <IMSI>, which is intended to permit the TE to identify the individual SIM card or active application in the UICC (GSM or USIM) which is attached to MT. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

#### Defined values:

<IMSI>: string, International Mobile Subscriber Identity (string without double quotes)

#### Example:

```
AT+CIMI
001010123456789
OK
```

# 7. Network Service Commands

## 7.1. AT+COPN Read Operator Names

### AT+COPN parameter command syntax

Command	Possible response(s)
+COPN	<p><i>Normally respond:</i></p> <p>+COPN:&lt;numeric1&gt;,&lt;alpha1&gt; [&lt;CR&gt;&lt;LF&gt;]+COPN:&lt;numeric2&gt;,&lt;alpha2&gt; [...]] OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+COPN=?	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
Reference:	3GPP TS 27.007

### Description:

The execute command returns the list of operator names from the MT. Each operator code <numericaln> that has an alphanumeric equivalent <alphan> in the MT memory shall be returned. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

### Defined values:

<numericn>: string, operator in numeric format (Refer to +COPS.)

<alphan>: string, operator in long alphanumeric format (Refer to +COPS.)

**Example:** Read operator names

```
AT+COPN
.....
+COPN: "90126", "TIMjsea"
+COPN: "90145", "AISatSea"
+COPN: "99899", "UZMOBILE"
OK
AT+COPN=?
OK
```

## 7.2. AT+COPS Operator Selection

### AT+COPS parameter command syntax

Command	Possible response(s)
+COPS=[<mode>[,<format> [,<oper>[,<AcT>]]]]]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+COPS?	<i>Normally respond:</i> +COPS:<mode>[,<format>,<oper>[,<AcT>]] OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>

<b>+COPS=?</b>	<p><i>Normally respond:</i></p> <p>+COPS: [list of supported (&lt;stat&gt;,long alphanumeric &lt;oper&gt;,short alphanumeric &lt;oper&gt;,numeric &lt;oper&gt;[,&lt;AcT&gt;])s][,(list of supported &lt;mode&gt;s),(list of supported &lt;format&gt;s)]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR: &lt;err&gt;</p>
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The set command forces an attempt to select and register the GSM/UMTS network operator. <mode> is used to select whether the selection is performed automatically by the MT or is forced by this command to operator <oper> (It shall be provided in format <format>.) to a certain access technology, indicated in <AcT>. If the selected operator is not available, no other operator shall be selected (except <mode>=4). If the selected access technology is not available, then the same operator shall be selected in other access technology. The selected operator name format shall also apply to further read commands (+COPS?). <mode>=2 forces an attempt to deregister from the network. The selected mode affects all further network registration. (E.g. after <mode>=2, MT shall not be registered until <mode>=0 or <mode>=1 is selected.) Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#). This command should be abortable when registration/deregistration attempts are made.

The read command returns the current mode, the currently selected operator, and the current Access Technology. If no operator is selected, <format>, <oper>, and <AcT> are omitted.

The test command returns a set of five parameters, each representing an operator present

in the network. A set consists of an integer indicating the availability of the operator <stat>, a long and short alphanumeric format of the name of the operator, a numeric format representation of the operator, and access technology. Any of the formats may be unavailable and should then be an empty field. The list of operators shall be in the following order: home network and networks referenced in the SIM or active application in the UICC (GSM or USIM) which will be subsequently in the following order: HPLMN selector, User controlled PLMN selector, Operator controlled PLMN selector and PLMN selector (in the SIM or GSM application), and other networks.

It is recommended (although optional) that after the operator list TA returns lists of supported <mode> and <format>, these lists shall be delimited from the operator list by two commas.

The access technology selected parameters <AcT> should only be used in terminals capable of registering to more than one access technology. Selection of <AcT> does not limit the capability to cell reselections, even though an attempt is made to select an access technology, the phone may still re-select a cell using another access technology.

#### **Defined values:**

<mode>: integer

- 0 – automatic (The <oper> field is ignored.)
- 1 – manual (The <oper> field shall be present; <AcT> is optional.)
- 2 – deregister from the network
- 3 – set only <format> (for read command +COPS?), do not attempt registration/deregistration (<oper> and <AcT> fields are ignored); this value is not applicable in cases of a read-command response.
- 4<sup>[\*\*]</sup> – manual/automatic (<oper> field shall be present); if manual selection fails, automatic mode (<mode>=0) is initiated.

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

<format>: integer

- 0 – long format alphanumeric <oper>
- 1 – short format alphanumeric <oper>
- 2 – numeric <oper>

<oper>: string, <format> indicates if the format is alphanumeric or numeric; long alphanumeric format can be up to 16 characters long and short format up to 8 characters (Refer to GSM MoU SE.13.); numeric format is the GSM Location Area

Identification number (Refer to 3GPP TS 24.008 subclause 10.5.1.3.) which consists of a three-BCD-digit country code coded as in ITU-T Recommendation E.212 Annex A, plus a two BCD digit network code, which is administration-specific; the returned <oper> shall not be in BCD format, but in IRA characters converted from BCD. The number is composed with the following structure: (country code digit 3)(country code digit 2)(country code digit 1)(network code digit 3)(network code digit 2)(network code digit 1)

<stat>: integer  
0 – unknown  
1 – available  
2 – current  
3 – forbidden

<AcT>: integer, access technology selected  
0<sup>[\*\*]</sup> – GSM  
1<sup>[\*\*]</sup> – GSM Compact  
2<sup>[\*\*]</sup> – UTRAN  
3<sup>[\*\*]</sup> – GSM w/EGPRS (Refer to Note 1.)  
4<sup>[\*\*]</sup> – UTRAN w/HSDPA (Refer to Note 2.)  
5<sup>[\*\*]</sup> – UTRAN w/HSUPA (Refer to Note 2.)  
6<sup>[\*\*]</sup> – UTRAN w/HSDPA and HSUPA (Refer to Note 2.)  
7 – E-UTRAN

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

#### Example:

Case 1: Network scan for M14A2A, UE need to disconnect the data call first.

```
at%CMATT=0
OK
at+cops=?  

+COPS: (1,"Test Usim","Test","00101",7),,(0-4),(0-2)
OK
at%CMATT=1
OK
```

Case 2: Set network name display format for M14A2A.

```
at+cops=3,0
OK
at+cops?
+COPS: 0,0,"Test Usim",7
OK
at+cops=3,1
OK
at+cops?
+COPS: 0,1,"Test Usim",7
OK
at+cops=3,2
OK
at+cops?
+COPS: 0,2,"00101",7
OK
```

Case 3: Scan network for M18Q2.

```
AT+COPS?
+cops: 0,0,"MD8475A_SmartStudio USIM",7
OK
AT+COPS=0,1
OK
AT+COPS=?
+cops:
(2,"MD8475A_SmartStudio","MD8475A","00101",7),,(0,1,2,3,4),(0,1,2)
OK
AT+COPS=0,1
OK
AT+COPS?
+cops: 0,1,"MD8475A USIM",7
OK
```

### 7.3. AT+CPOL Preferred Operator List

**AT+CPOL parameter command syntax**

Command	Possible response(s)
+CPOL=[<index>][,<format> [,<oper>[,<GSM_AcT>, <GSM_Compact_AcT>, <UTRAN_AcT>,<E-UTRAN_AcT>]]]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CPOL?	<i>Normally respond:</i> +CPOL:<index1>,<format>,<oper1>[,<GSM_AcT1>,<GSM_Compact_AcT1>,<UTRAN_AcT1>,<E-UTRAN_AcT1>] [<CR><LF>+CPOL:<index2>,<format>,<oper2>[,<GSM_AcT2>,<GSM_Compact_AcT2>,<UTRAN_AcT2>,<E-UTRAN_AcT2>] [...]] OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
+CPOL=?	<i>Normally respond:</i> +CPOL: (list of supported <index>s),(list of supported <format>s) OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
<b>Reference:</b>	3GPP TS 27.007

### Description:

This command is used to edit the PLMN selector with Access Technology lists in the SIM card or active application in the UICC (GSM or USIM).

The execute command writes an entry in the SIM/USIM list of preferred PLMNs, previously selected by the command +CPLS. If no list has been previously selected, the User controlled PLMN selector with Access Technology, EFPLMNwAcT, is the one accessed by default. If <index> is given but <oper> is omitted, entry is deleted. If <oper> is given but <index> is omitted, <oper> is put in the next free location. If only <format> is given, the format of the <oper> in the read command is changed. The Access Technology selection parameters, <GSM\_AcT>, <GSM\_Compact\_AcT>, and <UTRAN\_AcT> and <E-UTRAN\_AcT> are required when writing user-controlled PLMN selectors with Access Technology, EFPLMNwAcT, operator-controlled PLMN selectors with Access Technology EFOPLMNwAcT, and HPLMN selectors with Access Technology EFHPLMNwAcT. (Refer to 3GPP TS 31.102.) Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

**Note 1:** MT can also update the User controlled PLMN selector with Access Technology EFPLMNwAcT automatically when new networks are selected.

**Note 2:** The Operator controlled PLMN selector with Access Technology EFOPLMNwAcT can only be written if the write access condition in the SIM/USIM has been previously verified.

The read command returns all used entries from the SIM/USIM list of preferred PLMNs previously selected by the command +CPLS with the Access Technologies for each PLMN in the list.

The test command returns the whole index range supported by the SIM.

### Defined values:

<indexn>: integer, the order number of operators in the SIM/USIM preferred operator list

<format>: integer

0<sup>[\*\*]</sup> – long-format alphanumeric <oper>

1<sup>[\*\*]</sup> – short-format alphanumeric <oper>

2 – numeric <oper>

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

<opern>: string, <format> indicates if the format is alphanumeric or numeric (Refer to +COPS.)

<GSM\_AcTn>: integer, GSM access technology:

- 0 – access technology not selected
- 1 – access technology selected

<GSM\_Compact\_AcTn>: integer, GSM compact access technology

- 0 – access technology not selected
- 1 – access technology selected

<UTRAN\_AcTn>: integer type; UTRAN access technology

- 0 – access technology not selected
- 1 – access technology selected

<E-UTRAN\_AcTn>: integer, E-UTRAN access technology

- 0 – access technology not selected
- 1 – access technology selected

**Example:** Read preferred operator list

```
AT+CPOL?  
+CPOL: 1,2,"46008",0,0,0,1  
+CPOL: 2,2,"46000",0,0,0,1  
+CPOL: 3,2,"46002",0,0,0,1  
+CPOL: 4,2,"46007",0,0,0,1  
+CPOL: 5,2,"46008",0,0,1,0  
+CPOL: 6,2,"46000",0,0,1,0  
+CPOL: 7,2,"46002",0,0,1,0  
+CPOL: 8,2,"46007",0,0,1,0  
+CPOL: 9,2,"46008",1,0,0,0  
+CPOL: 10,2,"46000",1,0,0,0  
+CPOL: 11,2,"46002",1,0,0,0  
+CPOL: 12,2,"46007",1,0,0,0  
OK  
AT+CPOL=?  
+CPOL: (1-80),(0-2)  
OK  
AT+CPOL=1,0
```

```

OK
AT+CPOL?
+CPOL: 2,0,"CHINA MOBILE",0,0,0,1
+CPOL: 3,0,"CHINA MOBILE",0,0,0,1
+CPOL: 4,0,"CHINA MOBILE",0,0,0,1
+CPOL: 5,0,"CHINA MOBILE",0,0,1,0
+CPOL: 6,0,"CHINA MOBILE",0,0,1,0
+CPOL: 7,0,"CHINA MOBILE",0,0,1,0
+CPOL: 8,0,"CHINA MOBILE",0,0,1,0
+CPOL: 9,0,"CHINA MOBILE",1,0,0,0
+CPOL: 10,0,"CHINA MOBILE",1,0,0,0
+CPOL: 11,0,"CHINA MOBILE",1,0,0,0
+CPOL: 12,0,"CHINA MOBILE",1,0,0,0
OK

```

## 7.4. AT+CPLS Select Preferred Operator List

### AT+CPLS parameter command syntax

Command	Possible response(s)
+CPLS=<list>	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+CPLS?	<p><i>Normally respond:</i></p> <p>+CPLS:&lt;list&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+CPLS=?	<i>Normally respond:</i>

+CPLS:(list of supported <list>s)

OK

*If something is wrong, then respond:*

ERROR

or

+CME ERROR:<err>

**Reference:** 3GPP TS 27.007

#### Description:

This command is used to select one PLMN selector with Access Technology list in the SIM card or active application in the UICC (GSM or USIM), that is used by the +CPOL command.

The execute command selects a list in the SIM/USIM. Refer to [Table A-1 Error codes supported for CME commands for possible <err> values](#).

The read command returns the selected PLMN selector list from the SIM/USIM.

The test command returns the whole index range supported lists by the SIM/USIM.

#### Defined values:

<list>: integer

- 0 – User controlled PLMN selector with Access Technology EFPLMNwAcT, if not found in the SIM/UICC, then the PLMN preferred list EFPLMNsSel (This file is only available in the SIM card or GSM application selected in UICC.)
- 1 – Operator controlled PLMN selector with Access Technology EFOPLMNwAcT
- 2 – HPLMN selector with Access Technology EFHPLMNwAcT

**Example:** Select prefer network list for AT+CPOL operation

AT+CPLS?

+CPLS: 0

OK

```

AT+CPLS=?
+CPLS: 0,1,2
OK
AT+CPLS=1
OK
AT+CPLS?
+CPLS: 1
OK

```

## 7.5. AT+CREG Network Registration Status

### AT+CREG parameter command syntax

Command	Possible response(s)
+CREG=[<n>]	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CREG?	<p><i>Normally respond:</i></p> <p>+CREG:&lt;n&gt;,&lt;stat&gt;[,&lt;lac&gt;,&lt;ci&gt;[,&lt;AcT&gt;]]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CREG=?	<p><i>Normally respond:</i></p> <p>+CREG:(list of supported &lt;n&gt;)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
<b>Reference:</b>	3GPP TS 27.007

### Description:

The set command controls the presentation of an unsolicited result code +CREG: <stat> when <n>=1 and there is a change in the MT's circuit-mode network registration status or code +CREG: <stat>[,<lac>,<ci>[,<AcT>]] when <n>=2 and there is a change of the network cell.

**Note 1:** If the MT also supports GPRS services and/or EPS services, the +CGREG command and +CGREG: result codes and/or the +CEREG command and +CEREG: result codes apply to the registration status and location information for those services.

The read command returns the status of result-code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <lac>, <ci> and <AcT> are returned only when <n>=2 and MT is registered in the network. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

### Defined values:

<n>: integer

- 0 – disable network registration unsolicited result code
- 1 – enable network registration unsolicited result code +CREG: <stat>
- 2 – enable network registration and location information unsolicited result code +CREG: <stat>[,<lac>,<ci>[,<AcT>]]
- 3<sup>[\*]</sup> – enable network registration, location information and cause value information unsolicited result code +CREG:  
<stat>[,[<lac>],[<ci>],[<AcT>][,<cause\_type>,<reject\_cause>]]

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

<stat>: integer, circuit mode registration status

- 0 – not registered; MT is not currently searching a new operator to register to.
- 1 – registered, home network
- 2 – not registered; but MT is currently searching a new operator to register to.
- 3 – registration denied
- 4 – unknown
- 5 – registered, roaming

<lac>: string, two byte location area code or tracking area code in hexadecimal format (e.g. "00C3" equals 195 in decimal format)

<ci>: string, four byte GERAN/UTRAN/E-UTRAN cell ID in hexadecimal format

<AcT>: integer, access technology of the serving cell

- 0 – GSM
- 1 – GSM Compact
- 2 – UTRAN
- 3 – GSM w/EGPRS (Refer to Note 1.)
- 4 – UTRAN w/HSDPA (Refer to Note 2.)
- 5 – UTRAN w/HSUPA (Refer to Note 2.)
- 6 – UTRAN w/HSDPA and HSUPA (Refer to Note 2.)
- 7<sup>[\*]</sup> – E-UTRAN

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:** Query current registration status and enable registration status unsolicited notify.

```
AT+CREG?  
+CREG: 0,5  
OK  
AT+CREG=?  
+CREG: (0-2)  
OK  
AT+CREG=1  
OK  
AT+CREG?  
+CREG: 1,5  
OK  
at+cfun=0  
OK  
at+cfun=1  
OK  
+CREG: 2  
+CREG: 1
```

## 7.6. AT+CSQ Signal Quality

### AT+CSQ parameter command syntax

Command	Possible response(s)
+CSQ	<p><i>Normally respond:</i></p> <p>+CSQ:&lt;rssi&gt;,&lt;ber&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>
+CSQ=?	<p><i>Normally respond:</i></p> <p>+CSQ:(list of supported &lt;rssi&gt;s),(list of supported &lt;ber&gt;s)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
Reference:	3GPP TS 27.007

### Description:

The execution command returns the received signal strength indication <rssi> and channel bit error rate <ber> from the MT. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values.](#)

The test command returns values supported as compound values

### Defined values:

<rssi>: integer

0	-	-113 dBm or less
1	-	-111 dBm

2...30	–	-109 dBm to -53 dBm
31	–	-51 dBm or greater
99	–	not known or not detectable

<ber>: integer, channel bit error rate (in percent)

0...7	– as RXQUAL values in the table in 3GPP TS 45.008 subclause 8.2.4
99	– not known or not detectable

**Example:** Query signal quality

```
AT+CSQ
+csq: 26,99
OK
AT+CSQ=?
+CSQ: (0-31,99),(0-7,99)
OK
```

## 7.7. AT\$QCSYSMODE Quesy Current System Mode of ME

**AT\$QCSYSMODE parameter command syntax**

Command	Possible response(s)
\$QCSYSMODE?	<i>Normally respond:</i> \$QCSYSMODE:<sysmode> OK  <i>If something is wrong, then respond:</i> ERROR or +CME ERROR:<err>
<b>Reference:</b>	Qualcomm 80-VR432-1

**Description:**

Returns current system mode of ME Provides details regarding the support of LTE/HSUPA/HSDPA

**Defined values:**

```
<sysmode>: string,  
    "NOT DETERMINED"  
    "GSM"  
    "WCDMA"  
    "LTE"  
    "WCDMA - HSDPA"  
    "WCDMA - HSUPA"  
    "WCDMA - HSDPA and HSUPA"  
    "WCDMA - HSDPA+"  
    "WCDMA - HSDPA+ and HSUPA"  
    "WCDMA - DC HSDPA+"  
    "WCDMA - DC HSDPA+ and HSUPA"  
    "WCDMA - 64QAM HSDPA+"  
    "WCDMA - 64QAM HSDPA+ and HSUPA"  
    "WCDMA - DC HSDPA+ and DC HSUPA"
```

**Example:** Query current system mode

```
AT$QCSYSMODE?  
LTE  
OK
```

## 7.8. AT\$QCRSRP Display Neighbor Cell Information RSRP

**AT\$QCRSRP parameter command syntax**

Command	Possible response(s)
\$QCRSRP?	<i>Normally respond:</i> \$QCRSRP:<cell id><EARFCN><rsrp> OK

*If something is wrong, then respond:*

ERROR

or

+CME ERROR:<err>

**Reference:** Qualcomm 80-VR432-1

**Note:** Only the read command is supported.

**Description:**

This command is used to display neighbor cell information cell ID, EARFCN, RSRP.

**Defined values:**

<cell id>: integer

<EARFCN>: integer

<rsrp>: integer

**Example:** Query RSRP value

```
AT$QCRSRP?  
$QCRSRP: 000,2175,"-085.70"  
OK
```

## 7.9. AT\$QCRSRQ Display Neighbor Cell Information RSRQ

**AT\$QCRSRP parameter command syntax**

Command	Possible response(s)
\$QCRSRQ?	<i>Normally respond:</i> \$QCRSRQ:<cell id><EARFCN><rsrq> OK  <i>If something is wrong, then respond:</i> ERROR

or  
+CME ERROR:<err>

**Reference:** Qualcomm 80-VR432-1

**Note:** Only the read command is supported.

### Description:

This command is used to display neighbor cell information cell ID, EARFCN, RSRQ.

### Defined values:

<cell id>: integer

<EARFCN>: integer

<rsrq>: integer

**Example:** Query RSRQ value

```
AT$QCRSRQ?  
$QCRSRQ: 000,2175,"-09.60"  
OK
```

## 8. Packet Domain Related Commands

### 8.1. AT+CGACT PDP Context Activate Or Deactivate

#### AT+CGACT parameter command syntax

Command	Possible response(s)
+CGACT=[<state>[,<cid>[,<cid>[,...]]]]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CGACT?	<i>Normally respond:</i> +CGACT:<cid>,<state> [<CR><LF>+CGACT:<cid>,<state> [...]] OK  <i>If something is wrong, then respond:</i> ERROR
+CGACT=?	<i>Normally respond:</i> +CGACT:(list of supported <state>s) OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The execution command is used to activate or deactivate the specified PDP context(s).

**Defined values:**

<state>: integer, a numeric parameter that indicates the state of PDP context activation

0 – deactivated

1 – activated

<cid>: integer, a numeric parameter which specifies a particular PDP context definition.

(Refer to the +CGDCONT and +CGDSCONT commands.)

**Example:** PDP Context activation/deactivation

```
AT+CGACT?  
+CGACT: 1,1  
+CGACT: 2,0  
OK  
AT+CGACT=?  
+CGACT: (0,1)  
OK  
AT+CGACT=1  
OK  
AT+CGACT?  
+CGACT: 1,1  
+CGACT: 2,1  
OK
```

## 8.2. AT+CGDATA Enter Date State

### AT+CGDATA parameter command syntax

Command	Possible response(s)
+CGDATA=[<L2P>[,<cid>[,<cid>[,...]]]]	<p><i>Normally respond:</i></p> <p>CONNECT</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR:&lt;err&gt;</p>

+CGDATA=?	<i>Normally respond:</i> +CGDATA: (list of supported <L2P>s) OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The execution command causes the MT to perform whatever actions are necessary to establish communication between the TE and the network using one or more Packet Domain PDP types. This may include performing a PS attach and one or more PDP context activations. If the <L2P> parameter value is unacceptable to the MT, the MT shall return an ERROR or +CME ERROR response. Otherwise, the MT issues the intermediate result code CONNECT and enters a V.250 online data state.

Commands succeeding the +CGDATA command in the AT command line shall not be processed by the MT.

The detailed behavior after the online data state has been entered is dependent on the PDP type. It is described briefly in 3GPP TS 27.060 and in more detail in 3GPP TS 29.061 and the specifications for the relevant PDPs. The PS attachment and PDP context activation procedures may occur prior to or during the PDP startup if they have not already been performed using the +CGATT and +CGACT commands.

If context activation occurs during the PDP startup, one or more <cid> may be specified in order to provide the information needed for the context activation request(s).

During each PDP startup procedure, the MT may have access to some or all of the following information:

- The MT may have a priori knowledge; for example, it may implement only one PDP type.
- The command may have provided an <L2P> parameter value.

- The TE may provide a PDP type and/or PDP address to the MT during in the PDP startup procedure.

If any of this information is in conflict, the command will fail.

Any PDP type and/or PDP address present in the above information shall be compared with the PDP type and/or PDP address in any context definition specified in the command in the order in which their <cid> parameters appear. For a context definition to match:

- The PDP type must match exactly.
- The PDP addresses are considered “matching” if they are identical or if either or both addresses are unspecified. For example, a PPP NCP request specifying PDP type = IP and no PDP address would cause the MT to search through the specified context definitions for one with PDP type = IP and any PDP address.

The context shall be activated using the matched value for the PDP type and a static PDP address if available, together with the other information found in the PDP context definition. If a static PDP address is not available, then a dynamic address is requested.

If no <cid> is given or if there is no matching context definition, the MT shall attempt to activate the context with whatever information is available to the MT. The other context parameters shall be set to their default values.

If the activation is successful, data transfer may proceed.

After data transfer is complete and the layer 2 protocol termination procedure has successfully completed, the V.250 command state is re-entered and the MT returns the final result code “OK”.

In the event of an erroneous termination or a failure to start up, the V.250 command state is re-entered and the MT returns the final result code NO CARRIER or, if enabled, +CME ERROR. Attach, activate, and other errors may be reported.

The test command is used for requesting information on the supported layer 2 protocols. This command may be used in both normal and modem compatibility modes.

#### **Defined values:**

<L2P>: a string parameter that indicates the layer 2 protocol to be used between the TE and  
PPP – point-to-point protocol for a PDP such as IP

If the value is omitted, the layer 2 protocol is unspecified. Other values are reserved and will result in an ERROR response.

<cid>: integer, a numeric parameter which specifies a particular PDP context definition  
(Refer to the +CGDCONT and +CGDSCONT commands.)

**Example:** Enter PPP state

```
AT+CGDATA=?  
+CGDATA: ("PPP")  
OK  
AT+CGDATA="PPP",1  
CONNECT 1500000000
```

### 8.3. AT+CGATT GPRS Attach Or Detach

**AT+CGATT parameter command syntax**

Command	Possible response(s)
+CGATT=[<state>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CGATT?	<i>Normally respond:</i> +CGATT:<state> OK  <i>If something is wrong, then respond:</i> ERROR
+CGATT=?	<i>Normally respond:</i> +CGATT:(list of supported <state>s) OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

The execution command is used to attach the MT to, or detach the MT from, the Packet Domain service.

**Defined values:**

< state >: integer, a numeric parameter that indicates the state of PS attachment

0 – Detached

1 – Attached

**Example:** Detach/Attach network for M18Q2

```
AT+CGATT?  
+CGATT: 1  
OK  
AT+CGATT=?  
+CGATT: (0,1)  
OK  
AT+CGATT=0  
OK  
AT+CGATT?  
+CGATT: 0  
OK
```

## 8.4. AT+CGDCONT Define PDP Context

**AT+CGDCONT parameter command syntax**

Command	Possible response(s)
+CGDCONT=[<cid>[,<PDP_type>[<APN>[,<PDP_addr>[,<d_comp>[<h_comp>[,<IPv4AddrAlloc>[,<emergency indication>]]]]]]]]]	<i>Normally respond: OK If something is wrong, then respond: ERROR</i>
+CGDCONT?	<i>Normally respond:</i>

```
+CGDCONT:<cid>,<PDP_type>,<APN>,<PDP_addr>,<
d_comp>,<h_comp>[,<IPv4AddrAlloc>[,<emergency i
ndication>]]  

[<CR><LF>+CGDCONT:<cid>,<PDP_type>,<APN>,<PD
P_addr>,<d_comp>,<h_comp>[,<IPv4AddrAlloc>[,<e
mergency indication>]]  

[...]]  

OK
```

*If something is wrong, then respond:*

ERROR

**+CGDCONT=?**

*Normally respond:*

```
+CGDCONT:(range of supported
<cid>s),<PDP_type>,,,(list of supported
<d_comp>s),(list of supported <h_comp>s),(list of
supported <IPv4AddrAlloc>s),(list of supported
<emergency indication>s)  

[<CR><LF>+CGDCONT:(range of supported
<cid>s),<PDP_type>,,,(list of supported
<d_comp>s),(list of supported <h_comp>s),(list of
supported <IPv4AddrAlloc>s),(list of supported
<emergency indication>s)  

[...]]  

OK
```

*If something is wrong, then respond:*

ERROR

**Reference:**

3GPP TS 27.007

#### Description:

The set command specifies the PDP context parameter values for a PDP context identified

by the (local) context identification parameter <cid>. The number of PDP contexts that may be in a defined state at the same time is provided by the range returned by the test command.

For EPS, the PDN connection and its associated EPS default bearer is identified herewith.  
For EPS, the <PDP\_addr> parameter value shall be omitted.

A special form of the set command +CGDCONT=<cid> causes the values for the context number <cid> to become undefined.

The read command returns the current settings for each defined context.

The test command returns values supported as a compound value. If the MT supports several PDP types using the parameter <PDP\_type>, the parameter value ranges for each <PDP\_type> are returned on a separate line.

#### **Defined values:**

<cid>: integer, a numeric parameter which specifies a particular PDP context definition; the parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.

<PDP\_type>: string, a string parameter which specifies the type of packet data protocol  
IP – Internet Protocol (IETF STD 5)  
IPv6 – Internet Protocol, version 6 (IETF RFC 2460)  
IPV4V6 – Virtual <PDP\_type> introduced to handle dual IP stack UE capability.  
(Refer to 3GPP TS 24.301.)  
PPP – Point to Point Protocol (IETF STD 51)

<APN>: string, a string parameter which is a logical name that is used to select the GGSN or the external packet data network.  
If the value is null or omitted, then the subscription value will be requested.

<PDP\_addr>: string, a string parameter that identifies the MT in the address space applicable to the PDP.  
If the parameter value is null or omitted, then a value may be provided by the TE during the PDP startup procedure or, failing that, a dynamic address will be requested.

The read form of the command will continue to return the null string even if an address has been allocated during the PDP startup procedure. The allocated address(es) may be read

using the +CGPADDR command.

<d\_comp>: integer, a numeric parameter that controls PDP data compression (applicable for SNDCP only) (Refer to 3GPP TS 44.065.)

- 0 – off
- 1 – on (manufacturer-preferred compression)
- 2 – V.42bis
- 3 – V.44

Other values are reserved.

**Note:** M14A2A <d\_comp>: Data compression is not supported. Parameters are omitted.

<h\_comp>: integer, a numeric parameter that controls PDP header compression (Refer to 3GPP TS 44.065 and 3GPP TS 25.323.)

- 0 – off
- 1 – on (manufacturer-preferred compression)
- 2 – RFC1144 (applicable for SNDCP only)
- 3 – RFC2507
- 4 – RFC3095 (applicable for PDCP only)

Other values are reserved.

<IPv4AddrAlloc>: integer, a numeric parameter that controls how the MT/TA requests to get the IPv4 address information

- 0 – IPv4 Address Allocation through NAS Signaling
- 1 – IPv4 Address Allocated through DHCP

<Emergency Indication>: integer, a numeric parameter used to indicate whether the PDP context is for emergency bearer services

- 0 – PDP context is not for emergency bearer services.
- 1 – PDP context is for emergency bearer services.

**Example:** Modify APN profile

```
AT+CGDCONT?  
+CGDCONT:  
1,"IPV4V6","broadband","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0",0,0,0,0  
OK  
AT+CGDCONT=?  
+CGDCONT: (1-24,100-179),"IP",,(0-2),(0-4),(0-1),(0-1)
```

```

+CGDCONT: (1-24,100-179),"PPP",,(0-2),(0-4),(0-1),(0-1)
+CGDCONT: (1-24,100-179),"IPV6",,(0-2),(0-4),(0-1),(0-1)
+CGDCONT: (1-24,100-179),"IPV4V6",,(0-2),(0-4),(0-1),(0-1)
OK
AT+CGDCONT=2,"IPV4V6","test"
OK
AT+CGDCONT?
+CGDCONT:
1,"IPV4V6","broadband","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0",0,0,0,0
+CGDCONT:
2,"IPV4V6","test","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0",0,0,0,0
OK
AT+CGDCONT=3,"PPP","TESTPPP"
OK

```

## 8.5. AT+CGEREP GPRS Event Reporting

**AT+CGEREP parameter command syntax**

Command	Possible response(s)
+CGEREP=[<mode>[,<bfr>]]	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CGEREP?	<p><i>Normally respond:</i></p> <p>+CGEREP:&lt;mode&gt;,&lt;bfr&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CGEREP=?	<p><i>Normally respond:</i></p> <p>+CGEREP:(list of supported &lt;mode&gt;s),(list of supported &lt;bfr&gt;s)</p> <p>OK</p>

*If something is wrong, then respond:*

ERROR

**Reference:** 3GPP TS 27.007

### Description:

The set command enables or disables sending of unsolicited result codes, +CGEV: XXX from MT to TE in the case of certain events occurring in the Packet Domain MT or the network. The <mode> controls the processing of unsolicited result codes specified within this command. <bfr> controls the effect on buffered codes when <mode> 1 or <mode> 2 is entered. If a setting is not supported by the MT, ERROR or +CME ERROR: is returned.

The read command returns the current mode and buffer settings.

The test command returns the modes and buffer settings supported by the MT as compound values.

### Defined values:

<mode>: integer, a numeric parameter

- 0 – buffer unsolicited result codes in the MT; if the MT result code buffer is full, the oldest values can be discarded. No codes are forwarded to the TE.
- 1 – discard unsolicited result codes when the MT–TE link is reserved (e.g. in on-line data mode); otherwise forward them directly to the TE.
- 2 – buffer unsolicited result codes in the MT when the MT–TE link is reserved (e.g. in on-line data mode) and flush them to the TE when the MT–TE link becomes available; otherwise forward them directly to the TE.

<bfr>: integer, a numeric parameter

- 0 – The MT buffer of unsolicited result codes defined within this command is cleared when <mode> 1 or <mode> 2 is entered.
- 1 – MT buffer of unsolicited result codes defined within this command is flushed to the TE when <mode> 1 or <mode> 2 is entered. (An OK response shall be issued before flushing the codes.)

**Example:** Modify event report

```
AT+CGEREP?  
+CGEREP: 0,0  
OK  
AT+CGEREP=?  
+CGEREP: (0-2),(0-1)  
OK  
AT+CGEREP=1,1  
OK  
AT+CGEREP?  
+CGEREP: 1,1  
OK
```

## 8.6. AT+CGREG Packet Domain Network Registration

### Status

#### AT+CGREG parameter command syntax

Command	Possible response(s)
+CGREG=[<n>]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CGREG?	<i>Normally respond:</i> +CGREG:<n>,<stat>[,<lac>,<ci>[,<AcT>,<rac>]] OK  <i>If something is wrong, then respond:</i> ERROR
+CGREG=?	<i>Normally respond:</i> +CGREG:(list of supported <n>) OK

*If something is wrong, then respond:*

ERROR

**Reference:** 3GPP TS 27.007

### Description:

The set command controls the presentation of an unsolicited result code +CGREG: <stat> when <n>=1 and there is a change in the MT's GPRS network registration status or code +CGREG: <stat>[,<lac>,<ci>[,<AcT>,<rac>]] when <n>=2 and there is a change of the network cell.

The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <lac>, <ci>, <AcT>, and <rac> are returned only when <n>=2 and MT is registered in the network.

### Defined values:

<n>: integer, a numeric parameter

- 0 – Disable network registration unsolicited result code
- 1 – Enable network registration unsolicited result code +CGREG: <stat>
- 2 – Enable network registration and location information unsolicited result code +CGREG: <stat>[,<lac>,<ci>[,<AcT>,<rac>]]

<stat>: integer, a numeric parameter that indicates the GPRS registration status

- 0 – Not registered; MT is not currently searching an operator to register to.
- 1 – Registered, home network
- 2 – Not registered, but MT is currently trying to attach or searching an operator to register to.
- 3 – Registration denied
- 4 – Unknown
- 5 – Registered, roaming

<lac>: string, two byte location area code or tracking area code in hexadecimal format

(E.g. "00C3" equals 195 in decimal.)

<ci>: string, four byte GERAN/UTRAN/E-UTRAN cell ID in hexadecimal format

<AcT>: integer, a numeric parameter that indicates the access technology of the serving cell

- 0 – GSM
- 1 – GSM Compact
- 2 – UTRAN
- 3 – GSM w/EGPRS (Refer to Note 2.)
- 4 – UTRAN w/HSDPA (Refer to Note 3.)
- 5 – UTRAN w/HSUPA (Refer to Note 3.)
- 6 – UTRAN w/HSDPA and HSUPA (Refer to Note 3.)
- 7 – E-UTRAN

**Note 2:** 3GPP TS 44.060 specifies the System Information messages which provide information about whether the serving cell supports EGPRS.

**Note 3:** 3GPP TS 25.331 specifies the System Information blocks which provides information about whether the serving cell supports HSDPA or HSUPA.

<rac>: string, one byte routing area code in hexadecimal format

**Example:** Check current packet domain network registration status

```
AT+CGREG?  
+CGREG: 0,5  
OK  
AT+CGREG=?  
+CGREG: (0-2)  
OK  
AT+CGREG=1  
OK  
AT+CGREG?  
+CGREG: 1,5  
OK
```

## 8.7. AT+CEREG Packet Domain Network Registration Status

**AT+CEREG parameter command syntax**

Command	Possible response(s)
+CEREG=[<n>]	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CEREG?	<p><i>Normally respond:</i></p> <p>+CEREG:&lt;n&gt;,&lt;stat&gt;[,[&lt;tac&gt;],[&lt;ci&gt;],[&lt;AcT&gt;],&lt;cause_type&gt;,&lt;reject_cause&gt;]]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CEREG=?	<p><i>Normally respond:</i></p> <p>+CEREG:(list of supported &lt;n&gt;s)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
Reference:	3GPP TS 27.007

#### Description:

The set command controls the presentation of an unsolicited result code +CEREG: <stat> when <n>=1 and there is a change in the MT's EPS network registration status in E-UTRAN or unsolicited result code.

+CEREG: <stat>[,[<tac>],[<ci>],[<AcT>]] when <n>=2 and there is a change of the network cell in EUTRAN. The parameters <AcT>, <tac> and <ci> are sent only if available. The value <n>=3 further extends the unsolicited result code with [,<cause\_type>,<reject\_cause>] when available and when the value of <stat> is changed. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

**NOTE 1:** If the EPS MT in GERAN/UTRAN/E-UTRAN also supports circuit mode services and/or GPRS services, the +CREG command and +CREG: result codes and/or the +CGREG command and +CGREG: result codes apply to the registration status and location information for those services.

The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <tac>, <ci> and <AcT>, if available, are returned only when <n>=2 and MT is registered in the network. The parameters [<cause\_type>,<reject\_cause>], if available, are returned when <n>=3.

Test command returns values supported as a compound value.

**Defined values:**

<n>: integer

- 0 – Disable network registration unsolicited result code
- 1 – Enable network registration unsolicited result code +CEREG: <stat>
- 2 – Enable network registration and location information unsolicited result code +CEREG: <stat>[,<tac>],[<ci>],[<AcT>]]
- 3 – Enable network registration, location information, and EMM cause value information unsolicited result code +CEREG:<stat>[,<tac>],[<ci>],[<AcT>][,<cause\_type>,<reject\_cause>]]

<stat>: integer, indicates the EPS registration status

- 0 – Not registered, MT is not currently searching an operator to register to
- 1 – Registered, home network
- 2 – Not registered, but MT is currently trying to attach or searching an operator to register to
- 3 – Registration denied
- 4 – Unknown (e.g. out of E-UTRAN coverage)
- 5 – Registered, roaming
- 6 – Registered for "SMS only", home network (not applicable)
- 7 – Registered for "SMS only", roaming (not applicable)
- 8 – Attached for emergency bearer services only (Refer to NOTE 2)
- 9 – Registered for "CSFB not preferred", home network (not applicable)
- 10 – Registered for "CSFB not preferred", roaming (not applicable)

**NOTE 2:** 3GPP TS 24.008 and 3GPP TS 24.301 specify the condition when the MS is considered as attached for emergency bearer services.

<tac>: string, two byte tracking area code in hexadecimal format (e.g. "00C3" equals 195 in decimal)

<ci>: string, four byte E-UTRAN cell ID in hexadecimal format

<AcT>: integer, indicates the access technology of the serving cell

- 0 – GSM (not applicable)
- 1 – GSM Compact (not applicable)
- 2 – UTRAN (not applicable)
- 3 – GSM w/EGPRS (Refer to NOTE 3) (not applicable)
- 4 – UTRAN w/HSDPA (Refer to NOTE 4) (not applicable)
- 5 – UTRAN w/HSUPA (Refer to NOTE 4) (not applicable)
- 6 – UTRAN w/HSDPA and HSUPA (Refer to NOTE 4) (not applicable)
- 7 – E-UTRAN

**NOTE 3:** 3GPP TS 44.060 specifies the System Information messages which give the information about whether the serving cell supports EGPRS.

**NOTE 4:** 3GPP TS 25.331 specifies the System Information blocks which give the information about whether the serving cell supports HSDPA or HSUPA.

<cause\_type>: integer, indicates the type of <reject\_cause>.

- 0 – Indicates that <reject\_cause> contains an EMM cause value, Refer to 3GPP TS 24.301 Annex A.
- 1 – Indicates that <reject\_cause> contains a manufacturer-specific cause.

<reject\_cause>: integer, contains the cause of the failed registration. The value is of a type defined by <cause\_type>.

**Example:** Check LTE network registration status

```
AT+CEREG?  
+CEREG: 0,1  
OK  
AT+CEREG=?  
+CEREG: (0-2)  
OK  
AT+CEREG=1  
OK  
AT+CEREG?  
+CEREG: 1,1
```

```

OK
AT+CGATT=0
OK
+CEREG: 2

```

## 8.8. AT+CGCONTRDP PDP Context Read Dynamic

### Parameters

#### AT+CGCONTRDP parameter command syntax

Command	Possible response(s)
+CGCONTRDP[=<cid>]	<p><i>Normally respond:</i></p> <p>[+CGCONTRDP: &lt;cid&gt;,&lt;bearer_id&gt;,&lt;apn&gt;[,&lt;local_addr and subnet_mask&gt;[,&lt;gw_addr&gt;[,&lt;DNS_prim_addr&gt;[,&lt;DNS_sec_addr&gt;[,&lt;PCSCF_prim_addr&gt;[,&lt;PCSCF_sec_addr&gt;[,&lt;IM_CN_Signalling_Flag&gt;[,&lt;LIPA_indication&gt;]]]]]]]]]</p> <p>[&lt;CR&gt;&lt;LF&gt;+CGCONTRDP: &lt;cid&gt;,&lt;bearer_id&gt;,&lt;apn&gt;[,&lt;local_addr and subnet_mask&gt;[,&lt;gw_addr&gt;[,&lt;DNS_prim_addr&gt;[,&lt;DNS_sec_addr&gt;[,&lt;P-CSCF_prim_addr&gt;[,&lt;PCSCF_sec_addr&gt;[,&lt;IM_CN_Signalling_Flag&gt;[,&lt;LIPA_indication&gt;]]]]]]]]]</p> <p>[...]]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p> <p>or</p> <p>+CME ERROR: &lt;err&gt;</p>
+CGCONTRDP=?	<p><i>Normally respond:</i></p> <p>+CGCONTRDP: (list of &lt;cid&gt;s associated with active contexts)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>

or  
+CME ERROR: <err>

**Reference:** 3GPP TS 27.007

### Description:

The execution command returns the relevant information <bearer\_id>, <apn>, <local\_addr and subnet\_mask>, <gw\_addr>, <DNS\_prim\_addr>, <DNS\_sec\_addr>, <P-CSCF\_prim\_addr>, <PCSCF\_sec\_addr>, <IM\_CN\_Signalling\_Flag> and <LIPA\_indication> for an active non-secondary PDP context with the context identifier <cid>.

If the MT has dual-stack capabilities, two lines of information are returned per <cid>. The first line contains the IPv4 parameters followed by one line with the IPv6 parameters.

If the parameter <cid> is omitted, the relevant information for all active non-secondary PDP contexts is returned.

The test command returns a list of <cid>s associated with active non-secondary contexts.

### Defined values:

<cid>: integer, specifies a particular non-secondary PDP context definition. The parameter is local to the TE/MT interface and is used in other PDP context-related commands.  
(Refer to the +CGDCONT and +CGDSCONT commands.)

<bearer\_id>: integer, identifies the bearer, i.e. the EPS bearer in EPS and the NSAPI in UMTS/GPRS.

<apn>: string, a logical name that was used to select the GGSN or the external packet data network.

<local\_addr and subnet\_mask>: string, shows the IP address and subnet mask of the MT.  
The string is given as dot-separated numeric (0–255) parameters on the form:  
"a1.a2.a3.a4.m1.m2.m3.m4" for IPv4  
or "a1.a2.a3.a4.a5.a6.a7.a8.a9.a10.a11.a12.a13.a14.a15.a16.m1.m2.m3.m4.m5.m6.  
m7.m8.m9.m10.m11.m12.m13.m14.m15.m16" for IPv6. When +CGPIAF is

supported. Its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<gw\_addr>: string, shows the Gateway Address of the MT. The string is given as dot-separated numeric (0–255) parameters.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<DNS\_prim\_addr>: string, shows the IP address of the primary DNS server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<DNS\_sec\_addr>: string, shows the IP address of the secondary DNS server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<P\_CSCF\_prim\_addr>: string, shows the IP address of the primary P-CSCF server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<P\_CSCF\_sec\_addr>: string, shows the IP address of the secondary P-CSCF server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<IM\_CN\_Signalling\_Flag>: integer, shows whether the PDP context is for IM CN subsystem-related signalling only or not.

0 – PDP context is not for IM CN subsystem-related signalling only

1 – PDP context is for IM CN subsystem-related signalling only

<LIPA\_indication>: integer, indicates that the PDP context provides connectivity using a LIPA PDN connection. This parameter cannot be set by the TE.

0 – indication not received that the PDP context provides connectivity using a LIPA PDN connection

1 – indication received that the PDP context provides connectivity using a LIPA PDN connection

**Example:** Check current active PDP context status

```
AT+CGCONTRDP=?  
+CGCONTRDP: ( 1 )
```

```

OK
AT+CGCONTRDP=1
+CGCONTRDP: 1,5,broadband,192.168.1.1,,192.168.1.2,192.168.1.3
OK

```

## 8.9. AT+CGEQOS Define EPS Quality of Service

### AT+CGEQOS parameter command syntax

Command	Possible response(s)
+CGEQOS=[<cid>[,<QCI>[,<DL_GBR>,<UL_GBR>[,<DL_MBR>,<UL_MBR>]]]]	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
+CGEQOS?	<p><i>Normally respond:</i></p> <p>[+CGEQOS:  &lt;cid&gt;,&lt;QCI&gt;,[&lt;DL_GBR&gt;,&lt;UL_GBR&gt;],[&lt;DL_MBR&gt;,&lt;UL_MBR&gt;]]  [&lt;CR&gt;&gt;LF&gt;+CGEQOS:  &lt;cid&gt;,&lt;QCI&gt;,[&lt;DL_GBR&gt;,&lt;UL_GBR&gt;],[&lt;DL_MBR&gt;,&lt;UL_MBR&gt;][...]]  OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>

<b>+CGEQOS=?</b>	<p><i>Normally respond:</i></p> <p>+CGEQOS: (range of supported &lt;cid&gt;s),(list of supported &lt;QCI&gt;s),(list of supported &lt;DL_GBR&gt;s),(list of supported &lt;UL_GBR&gt;s),(list of supported &lt;DL_MBR&gt;s),(list of supported &lt;UL_MBR&gt;s)</p> <p>OK</p>
	<p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
<b>Reference:</b>	3GPP TS 27.007

#### Description:

The set command allows the TE to specify the EPS Quality of Service parameters <cid>, <QCI>, [<DL\_GBR> and <UL\_GBR>], and [<DL\_MBR> and <UL\_MBR>] for a PDP context or Traffic Flows. (Refer to 3GPP TS 24.301 and 3GPP TS 23.203.) When in UMTS/GPRS the MT applies a mapping function to UMTS/GPRS Quality of Service. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

A special form of the set command, +CGEQOS= <cid> causes the values for context number <cid> to become undefined.

The read command returns the current settings for each defined QoS.

The test command returns the ranges of the supported parameters.

#### Defined values:

<cid>: integer, specifies a particular EPS Traffic Flows definition in EPS and a PDP Context definition in UMTS/GPRS. (Refer to the +CGDCONT and +CGDSCONT commands.)

<QCI>: integer, specifies a class of EPS QoS. (Refer to 3GPP TS 24.301.)

0 QCI is selected by the network.

[1 – 4] value range for guaranteed bit rate Traffic Flows

[5 – 9] value range for non-guaranteed bit rate Traffic Flows

[128 – 254] value range for Operator-specific QCIs

<DL\_GBR>: integer, indicates DL GBR in case of GBR QCI; the value is in kbit/s. This parameter is omitted for a non-GBR QCI. (Refer to 3GPP TS 24.301).

<UL\_GBR>: integer, indicates UL GBR in case of GBR QCI. The value is in kbit/s. This parameter is omitted for a non-GBR QCI. (Refer to 3GPP TS 24.301.)

<DL\_MBR>: integer, indicates DL MBR in case of GBR QCI. The value is in kbit/s. This parameter is omitted for a non-GBR QCI. (Refer to 3GPP TS 24.301.)

<UL\_MBR>: integer, indicates UL MBR in case of GBR QCI. The value is in kbit/s. This parameter is omitted for a non-GBR QCI. (Refer to 3GPP TS 24.301.)

<cid>: integer, specifies a particular non-secondary PDP context definition. The parameter is local to the TE/MT interface and is used in other PDP context-related commands. (Refer to the +CGDCONT and +CGDSCONT commands.)

<bearer\_id>: integer, identifies the bearer, i.e. the EPS bearer in EPS and the NSAPI in UMTS/GPRS.

<apn>: string, a logical name that was used to select the GGSN or the external packet data network.

<local\_addr and subnet\_mask>: string, shows the IP address and subnet mask of the MT.

The string is given as dot-separated numeric (0–255) parameters on the form:

"a1.a2.a3.a4.m1.m2.m3.m4" for IPv4 or

"a1.a2.a3.a4.a5.a6.a7.a8.a9.a10.a11.a12.a13.a14.a15.a16.m1.m2.m3.m4.m5.m6.m7.m8.m9.m10.m11.m12.m13.m14.m15.m16" for IPv6. When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<gw\_addr>: string, shows the Gateway Address of the MT. The string is given as dot-separated numeric (0–255) parameters.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<DNS\_prim\_addr>: string, shows the IP address of the primary DNS server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<DNS\_sec\_addr>: string, shows the IP address of the secondary DNS server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<P\_CSCF\_prim\_addr>: string, shows the IP address of the primary P-CSCF server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<P\_CSCF\_sec\_addr>: string, shows the IP address of the secondary P-CSCF server.

When +CGPIAF is supported, its settings can influence the format of this parameter returned with the execute form of +CGCONTRDP.

<IM\_CN\_Signalling\_Flag>: integer, shows whether the PDP context is for IM CN subsystem-related signalling only or not.

0 – PDP context is not for IM CN subsystem-related signalling only.  
1 – PDP context is for IM CN subsystem-related signalling only.

<LIPA\_indication>: integer, indicates that the PDP context provides connectivity using a LIPA PDN connection. This parameter cannot be set by the TE.

0 – indication not received that the PDP context provides connectivity using a LIPA PDN connection  
1 – indication received that the PDP context provides connectivity using a LIPA PDN connection

**Example:** Query current EPS QOS parameter

```
at+cgeqos?  
+CGEQOS:  
OK  
at+cgeqos=?  
+CGEQOS:  
(1-24,100-179),(0-9),(0-150000),(0-50000),(0-150000),(0-50000)  
OK  
at+cgeqos=1,0  
OK
```

```

at+cgeqos?
+CGEQOS: 1,0,0,0,0,0
OK
at+cgeqos=2,1
OK
at+cgeqos?
+CGEQOS: 1,0,0,0,0,0
+CGEQOS: 2,1,0,0,0,0
OK

```

## 8.10. AT+CGPADDR Show PDP Address

### AT+CGPADDR parameter command syntax

Command	Possible response(s)
+CGPADDR=[<cid>[, <cid>[,...]]]	<i>Normally respond:</i> +CGPADDR:<cid>[,<PDP_addr_1>[,<PDP_addr_2>]] [<CR><LF>+CGPADDR: <cid>[<PDP_addr_1>[,<PDP_addr_2>]] [...]] OK
+CGPADDR=?	<i>If something is wrong, then respond:</i> ERROR
Reference:	3GPP TS 27.007

### Description:

The execution command returns a list of PDP addresses for the specified context identifiers.  
The test command returns a list of defined <cid>.

### Defined values:

<cid>: integer, a numeric parameter which specifies a particular PDP context definition  
(Refer to the +CGDCONT and +CGDSCONT commands.); if no <cid> is specified, the  
addresses for all defined contexts are returned.

<PDP\_addr\_1> and <PDP\_addr\_2>: each is a string that identifies the MT in the address  
space applicable to the PDP. The address may be static or dynamic. For a static  
address, it will be the address set by the +CGDCONT and +CGDSCONT commands  
when the context was defined. For a dynamic address, it will be the address  
assigned during the last PDP context activation that used the context definition  
referred to by <cid>. Both <PDP\_addr\_1> and <PDP\_addr\_2> are omitted if none are  
available. Both <PDP\_addr\_1> and <PDP\_addr\_2> are included when both IPv4 and  
IPv6 addresses are assigned, with <PDP\_addr\_1> containing the IPv4 address and  
<PDP\_addr\_2> containing the IPv6 address.

The string is provided as a dot-separated numeric (0–255) parameter of the form:  
a1.a2.a3.a4 for IPv4 and  
a1.a2.a3.a4.a5.a6.a7.a8.a9.a10.a11.a12.a13.a14.a15.a16 for IPv6.

### Example: Query current IP addresses

```
AT+CGPADDR=?  
+CGPADDR: (1,2)  
OK  
at+cgdcont?  
+CGDCONT:  
1,"IPV4V6","broadband","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0",0,0,0,0  
+CGDCONT:  
2,"IPV4V6","test","0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0",0,0,0,0  
OK  
at+cgpaddr=2  
+CGPADDR: 2,192.168.1.11  
OK
```

## 8.11. ATD\*99# Request Packet Domain service

ATD\*99# parameter command syntax

Command	Possible response(s)
ATD*99#	<i>Normally respond:</i> CONNECT  <i>If something is wrong, then respond:</i> ERROR
Reference:	3GPP TS 27.007

**Description:**

This command causes the MT to perform whatever actions are necessary to establish a communication between the TE and the external PDN.

**Defined values:**

**Example:** Request packet network service

```
ATD*99#
CONNECT 1500000000
```

## 8.12. AT\$QCPDPP Set Type of Authentication for PDP-IP

### Connections

AT\$QCPDPP parameter command syntax

Command	Possible response(s)
---------	----------------------

<b>\$QCPDPP= &lt;cid&gt;, &lt;auth_type&gt;, &lt;password&gt;, &lt;username&gt;</b>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>\$QCPDPP?</b>	<i>Normally respond:</i> \$QCPDPP: <cid>,<auth_type>,< username > OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Qualcomm 80-VR432-1

#### Description:

Sets the default secondary IP address used for Domain Name Services (DNS); used only if no DNS server address is received over the air during PDP context activation. The value is stored in NVRAM.

#### Defined values:

<username>: string, string of the PDP user name  
 <password>: string, string of the PDP password name  
 <cid>: integer, a value between 1 and 24  
 <auth\_type>: integer  
     0 – None  
     1 – PAP  
     2 – CHAP

#### Example: Query current authentication type

```
AT$QCPDPP?  
$QCPDPP: 1,0  
$QCPDPP: 2,0
```

```

OK
AT$QCPDPP=2,1,"testpass","testuser"
OK
AT$QCPDPP?
$QCPDPP: 1,0
$QCPDPP: 2,1,"testuser"
OK

```

## 8.13. AT%PDNSET Define PDP Context And Authentication

### AT%PDNSET parameter command syntax

Command	Possible response(s)
%PDNSET: <ext_session_id>[,<apnname>[,<ip_type>[<ppp_auth>[,<user>,<passw>[,<auth_host>]]],[<pcscf_discovery>]]]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
%PDNSET?	<i>Normally respond:</i> %PDNSET: <ext_session_id>[,<apnname>[,<ip_type>[<ppp_auth>[,<user>,<passw>[,<auth_host>]]],[<pcscf_discovery>]]] OK  <i>If something is wrong, then respond:</i> ERROR
%PDNSET=?	<i>Normally respond:</i> %PDNSET: <ext_session_id>[,<apnname>[,<ip_type>[<ppp_auth>[,<user>,<passw>[,<auth_host>]]],[<pcscf_discovery>]]] OK  <i>If something is wrong, then respond:</i> ERROR

**Reference:**

Altair\_SW\_201\_AT\_Commands  
Guide\_Rev3.pdf

**Description:**

The command is intended to set the run-time PDN parameters for data PDNs exposed to the host.

In addition, the APN name and IP type provided in the command will override the default PDN settings from the embedded APN table stored into the UE NV. The PPP security parameters are run-time only and are not stored into non-volatile memory.

The command will be effective immediately, which means that if parameters are different from those already in use, the PDN will be deactivated, updated locally and on the server (via LTE messages), and then reactivated.

If the <ip\_type> parameter is missing, the IPv4v6 will be applied.

Missed PPP security parameters will completely remove the previous PPP security setting.

The command is intended to substitute the previous %PPPAUTH command which is not synced with other PDN parameter definitions.

**Defined values:**

<ext\_session\_id>: integer, numeric value of the session identifier defined in the NP config file.

<apnname>: string, indicates the APN name configured for the PDN.

<ip\_type>: string

- “IP”
- “IPv6”
- “IPv4v6”

<ppp\_auth>: string , PPP authentication type

- “NONE”
- “PAP”

■ “CHAP”

<user>: string, username used for authentication  
<passw>: string, password used for authentication  
<auth\_host>: string, host name used for authentication (optional)  
<pcscf\_discovery>: integer, numeric value for PCSCF discovery

**Example:** Query and set APN profile

```
AT%PDNSET?  
%PDNSET: 1,internet11111,IP,,,,,0  
OK  
AT%PDNSET=?  
%PDNSET:  
<ext_session_id>[,<apnname>[,<ip_type>[,<ppp_auth>[,<user>,<passw>[,<auth_host>]]],[<pcscf_discovery>]]]  
OK  
AT%PDNSET=1,"internet","IPV4V6","CHAP","test","test","test_host",0  
OK  
AT%PDNSET?  
%PDNSET: 1,internet,IPV4V6,CHAP,test,test,test_host,0  
OK
```

## 8.14. AT\$QCRM CALL Triggers an RmNet Call

### AT\$QCRM CALL parameter command syntax

Command	Possible response(s)
\$QCRM CALL =<Action>, <Instance> [,<IP Type>[,<Tech Pref >[,<umts profile number>[,<cdma profile number>[,<APN>]]]]]	<i>Normally respond:</i> \$QCRM CALL: <Instance>,<IP Type> OK  <i>If something is wrong, then respond:</i> ERROR
\$QCRM CALL?	<i>Normally respond:</i> \$QCRM CALL: <Instance>,<IP Type> OK

	<i>If something is wrong, then respond:</i> ERROR
<b>\$QCRM CALL=?</b>	<i>Normally respond:</i> \$QCRM CALL: (list of defined <Action>s),(list of defined <Instance>s),(list of defined <IP Type>s),(list of defined <Tech Pref>s),(list of defined <umts profile number>s),(list of defined <cdma profile number>s), OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Qualcomm 80-VR432-1

### Description:

Command triggers an RmNet call based on the <Action> parameter which is typically a start of an RmNet Call or stop of a RmNet call.

### Defined values:

< Action >: integer

0 – Stop

1 – Start

<Instance>: integer, 1 to RMNET\_NUM\_LAPTOP\_INSTANCES

<IP Type>: integer, protocol type

1 – Ipv4

2 – Ipv6

3 – Ipv4v6

<Tech Pref>: integer, preference technology

1 – 3GPP2

2 – 3GPP

<umts\_profile>: integer, profile identifier from 1 to 24

<APN>: string, maximum length is 100 characters

**Example:** Start RMNET call

```
AT$QCRMCA LL?  
OK  
AT$QCRMCA LL=1,1  
$QCRMCA LL: 1, V4  
OK
```

## 8.15. AT+CNMPSD No More PS data

**AT+CNMPSD parameter command syntax**

Command	Possible response(s)
+CNMPSD	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
+CNMPSD=?	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	3GPP TS 27.007

**Description:**

This command indicates that no application on the MT is expected to exchange data. Upon receiving this command, the final result code “OK” is returned.

When in UTRAN, if further conditions defined in 3GPP TS 25.331 are met, this can cause transmission of a SIGNALLING CONNECTION RELEASE INDICATION message with the cause "UE Requested PS Data session end".

This command may be used in both normal and modem compatibility modes.

**Defined values:**

**Example:** No more ps data

```
AT+CNMPSD  
OK  
AT+CNMPSD=?  
OK
```

## 8.16. AT\$QCDNSP Sets Primary DNS IP Address

### AT\$QCDNSP parameter command syntax

Command	Possible response(s)
\$QCDNSP=<address>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
\$QCDNSP?	<i>Normally respond:</i> \$QCDNSP:<address > OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Qualcomm 80-VR432-1

**Description:**

Sets the default primary IP address used for Domain Name Services (DNS); used only if no DNS server address is received over the air during PDP context activation. The value is stored in NVRAM.

**Defined values:**

<address>: string, a string parameter which specifies an IP address.

**Example:** Set primary DNS

```
AT$QCDNSP?  
$QCDNSP: 0.0.0.0  
OK  
AT$QCDNSP=8.8.8.8  
OK  
AT$QCDNSP?  
$QCDNSP: 8.8.8.8  
OK
```

## 8.17. AT\$QCDNSS Sets Secondary DNS IP Address

**AT\$QCDNSS parameter command syntax**

Command	Possible response(s)
\$QCDNSS=<address>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
\$QCDNSS?	<i>Normally respond:</i> \$QCDNSS:<address> OK  <i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Qualcomm 80-VR432-1

**Description:**

Sets the default secondary IP address used for Domain Name Services (DNS); used only if no DNS server address is received over the air during PDP context activation. The value is stored in NVRAM.

**Defined values:**

<address>: string, a string parameter which specifies a IP address

**Example:** Set secondary DNS

```
AT$QCDNSS?  
$QCDNSS: 0.0.0.0  
OK  
AT$QCDNSS=8.8.8.8  
OK  
AT$QCDNSS?  
$QCDNSS: 8.8.8.8  
OK
```

## 8.18. AT\$QCDEFPROF Sets a Given Profile Number as a Default

**AT\$QCPDPCFG parameter command syntax**

Command	Possible response(s)
\$QCDEFPROF=<family>,<subs_id>,<profile_id>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR

<b>\$ QCDEFPROF?</b>	<i>Normally respond:</i> \$QCDEFPROF:<family>,<subs_id>,<profile_id> OK
	<i>If something is wrong, then respond:</i> ERROR\$QCDEFPROF:<family>,<subs_id>,<profile_id>
<b>Reference:</b>	Qualcomm 80-VR432-1

#### Description:

Sets the given profile number as the default profile for the family of the specified technology and subscription

#### Defined values:

<family>: imteger, range is from 1 to 16

<subs\_id>: integer, range is from 1 to 3. For non-DSDS targets, the <subs\_id> is limited to  
1.

<profile\_id>: integer, range is form 1 to 16

**Example:** Set default profile number

```
AT$QCDEFPROF=1,1,1
OK
AT$QCDEFPROF?
$QCDEFPROF: 0,1,1
$QCDEFPROF: 1,1,1
OK
```

## 8.19. AT\$ECMCALL Triggers an ECM Call

### AT\$ECMCALL parameter command syntax

Command	Possible response(s)
<b>\$ECMCALL=&lt;action&gt;</b>	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
<b>\$ECMCALL?</b>	<p><i>Normally respond:</i></p> <p>\$ECMCALL:&lt;status&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR\$ECMCALL:&lt;status&gt;</p>
<b>\$ECMCALL=?</b>	<p><i>Normally respond:</i></p> <p>\$ECMCALL: (list of defined &lt;action&gt;s)</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
<b>Reference</b>	

#### Description:

The command triggers an ECM call based on the <Action> parameter which is typically a start of an ECM Call or a stop of an ECM call.

#### Defined values:

<action>: integer

- 0 – Stop an ECM call.
- 1 – Start an ECM call.

<status>: integer

- 0 – No ECM call was started.

1 – An ECM call was started.

**Example:** Trigger an ECM call

```
AT$ECMCALL?  
$ECMCALL: 0  
OK  
AT$ECMCALL=?  
$ECMCALL: (0-1)  
OK  
AT$ECMCALL=1  
$ECMCALL: 1  
OK  
AT$ECMCALL?  
$ECMCALL: 1  
OK
```

## 8.20. AT%PDNACT PDP Context Activate Or Deactivate

**AT%PDNACT parameter command syntax**

Command	Possible response(s)
%PDNACT=<act>,[<sessionID>][,<apnname> >]	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
%PDNACT?	<i>Normally respond:</i> %PDNACT:<sessionID>,<stat>,<APN>,<cid> ][<CR><LF>%PDNACT:<sessionID>,<stat>,< APN>,<cid>][...]] OK  <i>If something is wrong, then respond:</i> ERROR

<b>%PDNACT=?</b>	<i>Normally respond:</i> %PDNACT: (list of defined <act>s),<ext_session_id> [,<APN>] OK
	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Altair_SW_201_AT_Commands Guide_Rev3.pdf

#### Description:

This command is used by external Host to instruct eCM to expose and connect (disconnect) specific PDN to the Host. There may be more than one PDN exposed to Host.

There may be more than one PDN exposed to Host.

Session ID is Altair proprietary session identifier, which is defined for each session established over-the-air in NP config file named '/etc/config/ecm'.

User can use <apnname> or <sessionID> or both to identify PDN. If both are defined, PDN is identified by <apnname>.

The PDNs terminated in modem cannot be exposed to Host and any attempt to activate them from host will return ERROR. PDN sharing between Host and modem is not supported yet.

#### Defined values:

<act>: integer, numeric value, indicates the required action.

0 – Deactivate

1 – Activate

<sessionID>: integer, numeric value of session identifier defined in NP config file.

<apnname>: string, indicates the APN name configured for the PDN.

<stat>: integer, numeric value, indicates the actual PDN state.

0 – Deactivate

1 – Activate

<cid>: integer, a numeric parameter which specifies a particular PDP context definition.

**Example:** Activate/Deactivate PDP context

```
AT%PDNACT?  
%PDNACT: 1,1,internet,1  
OK  
AT%PDNACT=?  
%PDNACT: (0-1), <ext_session_id> [,<APN>]  
OK  
AT%PDNACT=0,1  
OK  
AT%PDNACT?  
%PDNACT: 1,0,internet,1  
OK  
AT%PDNACT=1,1  
OK  
AT%PDNACT?  
%PDNACT: 1,1,internet,1  
OK
```

## 8.21. AT%CMATT LTE network Attach Or Detach

**AT%CMATT parameter command syntax**

Command	Possible response(s)
%CMATT=<act>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR

<b>%CMATT?</b>	<i>Normally respond:</i> %CMATT: <state> OK
<b>%CMATT=?</b>	<i>If something is wrong, then respond:</i> ERROR
<b>Reference:</b>	Altair_SW_201_AT_Commands Guide_Rev3.pdf

#### Description:

AT command sent from external Host, which instructs LTE module (eCM application) to attach or detach the LTE network.

#### Defined values:

<act>: integer, numeric value, instruct the device to attach or detach the LTE network.  
 0 – Detach  
 1 – Attach

**Example:** Detach/Attach LTE network

```
at%CMATT=0
OK
AT%CMATT?
%CMATT: 0
OK
at%CMATT=1
```

OK

AT%CMATT?

%CMATT: 1

OK

# 9. USIM related Commands

## 9.1. AT+CRSM Restricted SIM Access

AT+CRSM parameter command syntax

Command	Possible response(s)
+CRSM=<command>[,<fileid>[,<P1>,<P2>,<P3>[,<data>[,<pathid>]]]]	<p><i>Normally respond:</i></p> <p>+CRSM:&lt;sw1&gt;,&lt;sw2&gt;[,&lt;response&gt;]</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR or</p> <p>+CME ERROR: &lt;err&gt;</p>
+CRSM=?	<p><i>Normally respond:</i></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>ERROR</p>
Reference:	3GPP TS 27.007

**Description:**

By using this command instead of Generic SIM Access +CSIM TE application has easier but more limited access to the SIM database. Set command transmits to the MT the SIM <command> and its required parameters. If a SIM installed in the currently selected card slot, the MT handles internally all SIM-MT interface locking and file selection routines.

As response to the command, MT sends the actual SIM information parameters and response data. MT error result code +CME ERROR may be returned when the command cannot be passed to the SIM, but failure in the execution of the command in the SIM is

reported in <sw1> and <sw2> parameters. Refer to [Table A-1 Error codes supported for CMEE commands for possible <err> values](#).

Coordination of command requests to SIM and the ones issued by GSM/UMTS application inside the MT is implementation dependent. However the TE should be aware of the precedence of the GSM/UMTS application commands to the TE commands.

**Defined values:**

<command>: integer, command passed on by the MT to the SIM(refer to 3GPP TS 51.011).

176 – READ BINARY  
178 – READ RECORD  
192 – GET RESPONSE  
214 – UPDATE BINARY  
220 – UPDATE RECORD  
242 – STATUS  
203 – RETRIEVE DATA  
219 – SET DATA

All other values are reserved.

<fileid>: integer

<P1>, <P2>, <P3>: integer

<data>: string, information which shall be written to the SIM

<pathid>: string

**Example:** Read binary EFIMSI(28423)

```
AT+CRSM=176,28423,0,0,9
+CRSM: 144,0,"080910101032547698"
OK
```

## 9.2. AT+ICCID SIM Card Identification Number

### AT+ICCID parameter command syntax

Command	Possible response(s)
AT+ICCID	<i>Normally respond:</i> <iccid> OK

*If something is wrong, then respond:*

ERROR

**Reference:**

**Description:**

AT+CCID serves to query the SIM card identification number.

**Defined values:**

<iccid>: string, a string of 19 or 20 decimal digits, which reflects SIM ICCID value; the format of the ICCID is: MMCC IINN NNNN NNNN NN C x  
**MM** = Constant (ISO 7812 Major Industry Identifier)  
**CC** = Country Code  
**II** = Issuer Identifier  
**N{12}** = Account ID ("SIM number")  
**C** = Checksum calculated from the other 19 digits using the Luhn algorithm  
**x** = An extra 20th digit which may be returned by SIM, but it is not officially part of the ICCID.

**Example:** Read SIM card ICCID

```
AT+ICCID
ICCID: 89860012345678901234
OK
```

### 9.3. AT%CCID Reads the ICCID from SIM EFICCID

**AT%CCID Parameter parameter command syntax**

Command	Possible response(s)
%CCID	<i>Normally respond:</i>

<iccid>

OK

*If something is wrong, then respond:*

ERROR

**Reference:** Altair\_SW\_201\_AT\_Commands\_Guide\_Rev3.pdf

**Description:**

The execution command reads the ICCID (card identification number) from SIM EFICCID. It is a unique identification number for the SIM. If a SIM card is not inserted, the ERROR is returned by execution command.

**Defined values:**

<iccid>: string, a string of 19 or 20 decimal digits, which reflects SIM ICCID value; the format of the ICCID is: MMCC IINN NNNN NNNN NN C x

**MM** = Constant (ISO 7812 Major Industry Identifier)

**CC** = Country Code

**I**I = Issuer Identifier

**N{12}** = Account ID ("SIM number")

**C** = Checksum calculated from the other 19 digits using the Luhn algorithm

**x** = An extra 20th digit which may be returned by SIM, but it is not officially part of the ICCID.

**Example:** Read SIM card ICCID

AT%CCID

8952530076180102132

OK

# 10. Internet Service Commands

## 10.1. AT@INTERNET Start Internet Service

### AT@INTERNET parameter command syntax

Command	Possible response(s)
@INTERNET=<action>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> ERROR
@INTERNET?	@INTERNET:<status> OK
@INTERNET=?	@INTERNET:(0-1) OK

### Description:

This command is for switching to support Internet service or not based on the <action> parameter. When switching to support Internet service, it also implicitly changes the interface to type III, otherwise changes to type II(Please refer to SW Developer Guide for details). It is noted that this command should be the first command before any command goes. <action> parameter 0 is implicitly the default that means it is not necessary to switch explicitly by this command with <action> parameter 0. Executing Any other command firstly implicitly switch the interface to type II. Once starting Internet service, it is impossible to stop Internet service unless the system reboots. All of the following commands for Internet service only work after Internet service is started by this command.

### Defined values:

<action>: integer

- 1 – Start Internet service and implicitly change the interface to be type III.  
 0 – Don't start Internet service and implicitly change the interface to be type II.

<status>: integer

- 1 – Internet service was started.  
 0 – Internet service was not started.

**Example:**

```
AT@INTERNET=1
OK
AT@SOCKDIAL=1
OK
/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1
.....
```

## 10.2. AT@DNSSEVR DNS Server Setting

**AT@DNSSEVR parameter and command syntax**

Command	Possible response(s)
<b>AT@DNSSEVR=&lt;pri_sevr&gt;,</b> <i>Normally respond:</i>	
[<sec_sevr>]	OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
<b>AT@DNSSEVR?</b>	[@DNSSEVR:<pri_sevr>[,<sec_sevr>]] OK
<b>AT@DNSSEVR=?</b>	@DNSSEVR:(<pri_sevr>),(<sec_sevr>) OK

**Description:**

This command serves to query or set the manual DNS servers.

**Defined values:**

<pri\_sevr>: string, the primary DNS server IP address

<sec\_sevr>: string, the secondary DNS server IP address

<err\_code>: integer: error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Example:**

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@DNSSEVR="8.8.8.8"
OK

AT@DNSSEVR?
@DNSSEVR:"8.8.8.8"
OK
```

### 10.3. AT@DNSRESVDON Resolve Domain Name

**AT@DNSRESVDON parameter and command syntax**

Command	Possible response(s)
AT@DNSRESVDON=<domain_name>	<i>Normally respond:</i> [@DNSRESVDON:<ip_address>] [@DNSRESVDON:<ip_address>] .....

	OK
<i>If something is wrong, then respond:</i>	
	@EXTERR:<err_code>
<b>AT@DNSRESVDON?</b>	ERROR
<b>AT@DNSRESVDON=?</b>	@DNSRESVDON:(<ip_address>)
	OK

#### Description:

This command serves to resolve IP from domain name by querying a DNS server.

#### Defined values:

<domain\_name>: string, the domain name to be resolved  
 <ip\_address>: string, the IP address reported from the DNS server  
 <err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

#### Example:

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@DNSSEVR="8.8.8.8"
OK
```

```
AT@DNSRESVDON="www.wnc.com.tw"  
@DNSRESVDON:"10.37.238.17"  
OK
```

## 10.4. AT@SOCKDIAL Socket Dial-Up-Network

### AT@SOCKDIAL parameter and command syntax

Command	Possible response(s)
AT@SOCKDIAL=<action >	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@SOCKDIAL?	@SOCKDIAL:<status> OK
AT@SOCKDIAL=?	@SOCKDIAL:(0-1) OK

### Description:

This command serves to dial up the packet switch data service for socket connections.

### Defined values:

<action>: integer

0 – Hang up Network

1 – Dial up Network

<status>: integer

0 – No Dial up Network started

1 – A Dial up Network started

<err\_code> : integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

**Example:**

```
AT@INTERNET=1
```

```
OK
```

```
AT@SOCKDIAL=1
```

```
OK
```

```
/* The external host processor should wait for @SOCKDIAL:1 to make sure  
the socket data call is made successfully or not. */  
@SOCKDIAL:1
```

## 10.5. AT@SOCKCREATE Socket Creation

**AT@SOCKCREATE parameter and command syntax**

Command	Possible response(s)
---------	----------------------

<b>11. AT@SOCKCREATE=&lt;protocol_ty pe&gt;,&lt;ip_version&gt;</b>	<i>Normally respond:</i>  @SOCKCREATE:<socket_id> OK
<b>AT@SOCKCREATE?</b>	<i>If something is wrong, then respond:</i>  @EXTERR:<err_code> [@SOCKCREATE:<socket_id>[,<socket_id>[,...]]] OK
<b>AT@SOCKCREATE=?</b>	12. @SOCKCREATE:(1-2),(0-1) OK

#### Description:

This command serves to create a socket.

#### Defined values:

<socket\_id>: integer, the identifier of the created socket

<protocol\_type>: integer

1 – TCP

2 – UDP

<ip\_version>: integer

0 – IPv4

1 – IPv6

<err\_code>: integer, error code: refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

## 12.1. AT@SOCKCONN Socket Connect

### AT@SOCKCONN parameter and command syntax

Command	Possible response(s)
---------	----------------------

<b>AT@SOCKCONN=&lt;socket_id&gt;,&lt; destination_ip_address&gt;,&lt;remote port&gt;[,&lt;connection_timeout &gt;]</b>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTRERR:<err_code>
<b>AT@SOCKCONN?</b>	[@SOCKCONN:<socket_id>[,<socket_id>[,...]]] OK
<b>AT@SOCKCONN=?</b>	@SOCKCONN:(1-6),(<destination_ip_address>),(1-655 35)[,(30-360)] OK

#### Description:

This command serves to connect a remote server for the specific TCP socket.

#### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<destination\_ip\_address>: string, the IP address of the destination server

<remote\_port>: integer, the specific remote port in the target destination; the range is 1–65,535.

<connection\_timeout>: integer, the connection timeout for immediate response if the TCP session cannot connect to the target destination; the range is 30–360 (in seconds). Default is 120.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTRERR commands](#).

## 12.2. AT@SOCKREAD Socket Read

### AT@SOCKREAD parameter and command syntax

Command	Possible response(s)
---------	----------------------

<b>AT@SOCKREAD=&lt;socket_id&gt;,&lt;max_length&gt;</b>	<i>Normally respond:</i> @SOCKREAD:<actual_length>,<hex_data> OK @SOCKDATAIND: <socket_id>,<still_left>
	<i>If something is wrong, then respond:</i> @EXTRR:<err_code>
<b>AT@SOCKREAD?</b>	ERROR
<b>AT@SOCKREAD=?</b>	@SOCKREAD:(1-6),(1-1500) OK

### Description:

This command serves to read the data stored in the buffer of the specified socket.

### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<max\_length>: integer, the requested length of the data to be read; the range is 1–1,500 (in bytes).

<actual\_length>: integer, the actual length of data which were read out; the range is 0–1,500 (in bytes).

<hex\_data>: string, <actual\_length> bytes of data with binary-coded hexadecimal format to be read from the specific socket. The external host processor side needs to convert the binary-coded hexadecimal format to original payload data (For example, <hex\_data> which is a string “302A48D5” will be converted to be an array which is 0x30 0x2A 0x48 0xD5 at the external host processor side).

<still\_left>: integer, a indication for notifying that there are still data waiting for reading from the specific socket.(Please refer to [10.8 @SOCKDATAIND Notification for Data Received.](#))

0 – Nothing was received yet.

1 – Something were received.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#).

## 12.3. @SOCKDATAIND Notification for Data Received

### @SOCKDATAIND parameter command syntax

Command	Possible response(s)
@SOCKDATAIND=<socket_id>,<still_left>	
<b>Reference:</b>	
<b>Note:</b>	Unsolicited Response Message

### Description:

Notification for data received from the specific TCP/UDP socket. After being indicated by this notification, the external host processor should retrieve data from the data module by AT@SOCKREAD as soon as possible. If the external host processor doesn't retrieve data quickly enough, it is possible that TCP/UDP packets will be lost forever. Under this condition, the external host processor has responsibility to negotiate with the server for data retransmission.

### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<still\_left>: integer, a indication for notifying that there are still data waiting for reading from the specific socket.

- 0 – Nothing was received yet.
- 1 – Something were received.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#)

## 12.4. AT@SOCKWRITE Socket Write

### AT@SOCKWRITE parameter and command syntax

Command	Possible response(s)
AT@SOCKWRITE=<socket_id>,<write_bytes>,<hex_data>	<i>Normally respond:</i> @SOCKWRITE:<actual_length> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@SOCKWRITE?	ERROR
AT@SOCKWRITE=?	@SOCKWRITE:(1-6),(1-1500),(<hex_data>)OK

### Description:

This command serves to write data to the specified socket.

### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<write\_byte>: integer, the requested length of data to be written; the range is 1–1,500 (in bytes).

<hex\_data>: string, <actual\_length> bytes of data with binary-coded hexadecimal format to be written into the specific socket. The external host processor side needs to convert the original payload data to the binary-coded hexadecimal format (For example, the original payload data which is an array 0x30 0x2A 0x48 0xD5 will be converted to <hex\_data> which is a string “302A48D5” sent from the external host processor side).

<actual\_length>: integer, the actual length of data which were written; the range is 0–1,500 (in bytes).

<err\_code>: integer: error code; refer to [Table B-1: Error codes supported for @EXTERR](#)

[commands](#).

**Example:**

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@SOCKCREAT=1
@SOCKCREAT:1
OK

AT@DNSRESVDON="www.wnc.com.tw"
@DNSRESVDON="10.37.238.17"
OK

AT@SOCKCONN=1,"10.37.238.17",80
OK

/* The content sent by this command is as the below:

## 12.5. AT@SOCKRECV UDP Socket Data Receive

**AT@SOCKRECV parameter and command syntax**

Command	Possible response(s)
<b>AT@SOCKRECV=&lt;socket_i d&gt;,&lt;max_length&gt;</b>	<i>Normally respond:</i> <b>@SOCKRECV:&lt;actual_length&gt;,&lt;hex_data&gt;</b> <b>OK</b> <b>@SOCKDATAIND: &lt;socket_id&gt;,&lt;still_left&gt;</b>  <i>If something is wrong, then respond:</i>

	@EXTERR:<err_code>
AT@SOCKRECV?	ERROR
AT@SOCKRECV =?	@SOCKRECV:(1-6),(1-1500)
	OK

### Description:

This command serves to receive the data stored in the buffer of the specified UDP socket.

### Defined values:

<socket\_id>: integer, the identifier of the specified UDP socket

<max\_length>: integer, the requested length of the data to be received; the range is 1–1,500 (in bytes).

<actual\_length>: integer, the actual length of data which are received; the range is 0–1,500 (in bytes).

<hex\_data>: string, <actual\_length> bytes of data with binary-coded hexadecimal format to be received from the specific UDP socket. The external host processor side needs to convert the binary-coded hexadecimal format to original payload data (For example, <hex\_data> which is a string “302A48D5” will be converted to be an array which is 0x30 0x2A 0x48 0xD5 at the external host processor side).

<still\_left>: integer, a indication for notifying that there are still data waiting for receiving from the specific UDP socket.(Please refer to [10.8 @SOCKDATAIND Notification for Data Received.](#))

0 – Nothing was received yet.

1 – Something were received.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

## 12.6. AT@SOCKSEND UDP Socket Data Send

### AT@SOCKSEND parameter and command syntax

Command	Possible response(s)
AT@SOCKSEND=<socket_i_d>,<write_bytes>,<hex_data>	<i>Normally respond:</i> @SOCKSEND:<actual_length>  OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@SOCKSEND?	ERROR
AT@SOCKSEND=?	@SOCKSEND:(1-6),(1-1500),(<hex_data>)  OK

### Description:

This command serves to send data to the specified UDP socket.

### Defined values:

<socket\_id>: integer, the identifier of the specified UDP socket

<write\_byte>: integer, the requested length of data to be sent; the range is 1–1,500 (in bytes).

<hex\_data>: string, <actual\_length> bytes of data with binary-coded hexadecimal format to be written into the specific UDP socket. The external host processor side needs to convert the original payload data to the binary-coded hexadecimal format (For example, the original payload data which is an array 0x30 0x2A 0x48 0xD5 will be converted to <hex\_data> which is a string “302A48D5” sent from the external host processor side).

<actual\_length>: integer, the actual length of data which are sent; the range is 0–1,500 (in bytes).

<err\_code>: integer: error code; refer to [Table B-1: Error codes supported for @EXTERR](#)

[commands](#).

## 12.7. AT@SOCKCLOSE Socket Close

AT@SOCKCLOSE parameter and command syntax

Command	Possible response(s)
AT@SOCKCLOSE=<socket_id>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@SOCKCLOSE?	ERROR
AT@SOCKCLOSE=?	@SOCKCLOSE:(1-6) OK

### Description:

This command serves to close the specified socket.

### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

## 12.8. AT@SOCKERR Socket Error Code

AT@SOCKERR parameter and command syntax

Command	Possible response(s)
AT@SOCKERR=<socket_id>	<i>Normally respond:</i>

	@SOCKERR:<error_code>
	OK
<i>If something is wrong, then respond:</i>	
	@EXTERR:<err_code>
<b>AT@SOCKERR?</b>	ERROR
<b>AT@SOCKERR=?</b>	@SOCKERR:(1-6)
	OK

#### Description:

This command serves to get the last error code of the specified socket.

#### Defined values:

<socket\_id>: integer, the identifier of the specified socket

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

#### Example:

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@SOCKCREATE=1
@SOCKCREATE:1
OK
```

```

AT@DNSRESVDON="www.wnc.com.tw"
@DNSRESVDON="10.37.238.17"
OK

/* Something failed happened when connecting. */
AT@SOCKCONN=1,"10.37.238.17",80
@EXTERR:517

/* Get the last failed reason of socket connection, return the failure
is that no response is from the server. */
AT@SOCKERR=1
@SOCKERR:520
OK

```

## 12.9. AT@FTPOPEN FTP Open

### AT@FTPOPEN parameter and command syntax

Command	Possible response(s)
AT@FTPOPEN=<server_ip> >,[<port>],[“<user_name> ”],[“<password>”][,[< trans_type>]]	<i>Normally respond:</i> OK <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@FTPOPEN?	ERROR
AT@FTPOPEN=?	@FTPOPEN:<server_ip>,(1-65535),[<user_name>],[<passwo rd>][,(0-1)] OK

### Description:

This command serves to connect to the specified FTP server.

**Defined values:**

<server\_ip>: string, IP address of the specified FTP server  
<port>: integer, FTP service port; the default port is 21, and the range is 1–65,535.  
<user\_name>: string, user name for the FTP login  
<password>: string, password for the FTP login  
<trans\_type>: integer, file transfer type  
    0 – binary (default)  
    1 – ascii  
<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#).

## 12.10. AT@FTPCLOSE FTP Close

### AT@FTPCLOSE parameter and command syntax

Command	Possible response(s)
AT@FTPCLOSE	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTER:<err_code>
AT@FTPCLOSE?	ERROR
AT@FTPCLOSE=?	OK

**Description:**

This command serves to close the connection to the specified FTP server.

**Defined values:**

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#).

## 12.11. AT@FTPGET FTP GET Operation

**AT@FTPGET parameter and command syntax**

Command	Possible response(s)
<b>AT@FTPGET=&lt;file_name&gt;</b>	<i>Normally respond:</i>  OK  <i>If something is wrong, then respond:</i> @EXTER:<err_code>
<b>AT@FTPGET?</b>	ERROR
<b>AT@FTPGET=?</b>	@FTPGET:<file_name>  OK

### Description:

This command to perform the GET operation from the specified FTP server.

### Defined values:

<file\_name>: string, the file name with the full path of its file size to be stored at the specified FTP site

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#).

## 12.12. AT@FTPGETDATA FTP GET data

### AT@FTPGETDATA parameter and command syntax

Command	Possible response(s)
AT@FTPGETDATA	<p><i>Normally respond:</i></p> <p>@FTPGETDATA=&lt;remain&gt;,&lt;hex_data_len&gt;,&lt;hex_data&gt;</p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p>@EXTERR:&lt;err_code&gt;</p>
AT@FTPGETDATA?	ERROR
AT@FTPGETDATA=?	@FTPGETDATA: OK

### Description:

This command serves to get file content from the specified FTP server.

### Defined values:

<remain>: integer,

0 – There is no remaining data to get (I.e. the entire GET operation has been completed)

other value – There are remaining data to get

<hex\_data\_length>: integer, the actual length of <hex\_data> gotten from the FTP server.

<hex\_data>: string, <hex\_data\_length> bytes of data with binary-coded hexadecimal format which were gotten from the FTP server. The external host processor side needs to convert the binary-coded hexadecimal format to original payload data (For example, <hex\_data> which is a string “302A48D5” will be converted to be an array which is 0x30 0x2A 0x48 0xD5 at the external host processor side).

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Example:**

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@DNSRESVDON="ftp.wnc.com.tw"
@DNSRESVDON="10.37.238.117"
OK

AT@FTPOPEN="10.37.238.117",,""
OK

AT@FTPGET="/test.txt"
OK

AT@FTPSIZE="/test.txt"
@FTPSIZE:20
OK

/* Retrieve from the file test.txt with text content as the below:
This is a test file.
*/
AT@FTPGETDATA
@FTPGETDATA:0,20,"54686973206973206120746573742066696C652E"
OK

AT@FTPCLOSE
OK
```

## 12.13. AT@FTPFILSIZE FTP Query File Size

**AT@FTPFILSIZE parameter and command syntax**

Command	Possible response(s)
AT@FTPFILSIZE=<file_name>	<i>Normally respond:</i> @FTPFILSIZE:<file_size> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@FTPFILSIZE?	ERROR
AT@FTPFILSIZE=?	@FTPFILSIZE:<file_name> OK

### Description:

This command serves to query the specified file size from the specified FTP server.

### Defined values:

<file\_name>: string, the file name with the full path stored at the specified FTP site

<file\_size>: integer, The file size of the specified file is reported from the specified FTP site.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

## 12.14. AT@FTPPUT FTP PUT Operation

**AT@FTPPUT parameter and command syntax**

Command	Possible response(s)
---------	----------------------

<b>AT@FTPPUT=&lt;file_name&gt;</b>	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> @EXTERR:<err_code>
<b>AT@FTPPUT?</b>	ERROR
<b>AT@FTPPUT=?</b>	@FTPPUT:<file_name> OK

#### Description:

This command serves to perform the PUT operation to the specified FTP server.

#### Defined values:

<file\_name>: string, the file name with the full path stored at the specified FTP site  
 <err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

## 12.15. AT@ FTTPUTDATA FTP PUT data

#### AT@FTPPUTDATA parameter and command syntax

Command	Possible response(s)
<b>AT@FTPPUTDATA=&lt;remain&gt;,&lt;hex_data_len&gt;,&lt;hex_data&gt;</b>	<i>Normally respond:</i> OK
	<i>If something is wrong, then respond:</i> @EXTERR:<err_code>
<b>AT@FTPPUTDATA?</b>	ERROR
<b>AT@FTPPUTDATA=?</b>	@FTPPUTDATA:(<remain>),<hex_data_len>,(<hex_data>) OK

**Description:**

This command serves to upload file content to the specified FTP server.

**Defined values:**

<remain>: integer

0 – There is no remaining data to upload (that is, the whole PUT operation will be complete after this operation.)

1 – There is remaining data to upload.

<hex\_data\_length>: integer, the actual length of <hex\_data> to be put to the FTP server.

<hex\_data>: string, <hex\_data\_length> bytes of data with binary-coded hexadecimal format which will be put to the FTP server. The external host processor side needs to convert the original payload data to the binary-coded hexadecimal format (For example, the original payload data which is an array 0x30 0x2A 0x48 0xD5 will be converted to <hex\_data> which is a string “302A48D5” sent from the external host processor side).

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

**Example:**

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1
```

```

AT@DNSRESVDON="ftp.wnc.com.tw"
@DNSRESVDON="10.37.238.117"
OK

AT@FTPOPEN="10.37.238.117",,""
OK

AT@FTPPUT="/test.txt"
OK

/* Write text content as the below to the file test.txt:
This is a test file.
*/
AT@FTPPUTDATA
@FTPPUTDATA:0,40,"54686973206973206120746573742066696C652E"
OK

AT@FTPFILESIZE="/test.txt"
@FTPFILESIZE:20
OK

AT@FTPCLOSE
OK

```

## 12.16. AT@FTPDEL FTP Delete File

### AT@FTPDEL parameter and command syntax

Command	Possible response(s)
AT@FTPDEL=<file_name>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@FTPDEL?	ERROR

<b>AT@FTPDEL=?</b>	@FTPDEL:<file_name>
	OK

**Description:**

This command serves to perform the DELETE operation for a file on the specified FTP server.

**Defined values:**

<file\_name>: string, the file name with the full path stored at the specified FTP site

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

## 12.17. AT@PINGREQ Ping Request

**AT@PINGREQ parameter and command syntax**

Command	Possible response(s)
<b>AT@PINGREQ=&lt;ip_address&gt;[,&lt;retry_num&gt;[,&lt;timeout&gt;]]]</b>	<p><i>Normally respond:</i></p> <p>@PINGREQ:&lt;reply_id&gt;,&lt;ip_address&gt;,&lt;reply_time&gt;,&lt;ttl&gt;            .....            OK</p> <p><i>If something is wrong, then respond:</i></p> <p>@EXTERR:&lt;err_code&gt;</p>
<b>AT@PINGREQ?</b>	ERROR
<b>AT@PINGREQ=?</b>	<p>@PINGREQ :(&lt;ip_address&gt;)[,(&lt;retry_num&gt;)[,[&lt;timeout&gt;]]]</p> <p>OK</p>

**Description:**

This command serves to send a PING request.

**Defined values:**

<ip\_address>: string, the IP address to be pinged  
<retry\_num>: integer, the retry number for requesting a ping  
<timeout>: integer, the timeout waiting for a single echo reply; the range is 1–600 (in 100 ms increments), and the default is 50.  
<ttl>: integer, time to live; the range is 1–255, and the default is 128.  
<reply\_id>: integer, the identifier for individual reply of the ping request  
<reply\_time>: integer, the range is 1–600 (in 100 ms increments).  
<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Example:**

```
AT@INTERNET=1
OK

AT@SOCKDIAL=1
OK

/* The external host processor should wait for @SOCKDIAL:1 to make sure
the socket data call is made successfully or not. */
@SOCKDIAL:1

AT@DNSRESVDON="www.wnc.com.tw"
@DNSRESVDON="10.37.238.17"
OK

AT@PINGREQ="10.37.238.17"
@PINGREQ:1,"10.37.238.17",17,128
@PINGREQ:2,"10.37.238.17",19,128
```

```
@PINGREQ:3,"10.37.238.17",23,128  
OK
```

## 13. Hardware Related Commands

### 13.1. AT@GPIOREQ Request to Control A GPIO

AT@GPIOREG parameter and command syntax

Command	Possible response(s)
AT@GPIOREQ=<action>,<pin>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@GPIOREQ?	ERROR
AT@GPIOREQ=?	@GPIOREQ:(0-1),(<pin>) OK

#### Description:

This command serves to enable the specific pin to be a GPIO.

#### Defined values:

<action>: integer

0 – Disable the specific pin to be a GPIO.

1 – Enable the specific pin to be a GPIO.

<pin><sup>[#1]</sup>: integer, the specific pin to be controlled.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Note #1:** M14A2A support GPIO 1, 2, 3, 4, 5, 6, 7, 8, 46, 47, 48, 49, 87, 93, 94, 95, 96, 97; M18Q2 support GPIO 2, 3, 4, 7, 94, 95, 96.

## 13.2. AT@GPIOCFG Configure The Specific GPIO

AT@GPIOCFG parameter and command syntax

Command	Possible response(s)
<b>AT@GPIOCFG=&lt;pin&gt;,&lt;directi on&gt;[,&lt;state&gt;]</b>	<p><i>When the command is AT@GPIOCFG=&lt;pin&gt;,0</i> <i>Normally respond:</i> OK</p> <p><i>If something is wrong, then respond:</i> @EXTERR:&lt;err_code&gt;</p> <p><i>When the command is AT@GPIOCFG=&lt;pin&gt;,0,&lt;state&gt;</i> <i>Always respond:</i> @EXTERR:&lt;err_code&gt;</p> <p><i>When the command is AT@GPIOCFG=&lt;pin&gt;,1,&lt;state&gt;</i> <i>Normally respond:</i> OK</p> <p><i>If something is wrong, then respond:</i> @EXTERR:&lt;err_code&gt;</p> <p><i>When the command is AT@GPIOCFG=&lt;pin&gt;,1</i> <i>Always respond:</i> @EXTERR:&lt;err_code&gt;</p>
<b>AT@GPIOCFG?</b>	ERROR
<b>AT@GPIOCFG=?</b>	@GPIOCFG:(<pin>),(0-1)[,(0-1)] OK

**Description:**

This command serves to configure the specific GPIO.

**Defined values:**

<pin>: integer, the specific pin to be controlled.

<direction>: integer

0 – Configure to be an input pin.

1 – Configure to be an output pin.

<state>: integer

0 – Set the voltage level of the specific pin to be low (default).

1 – Set the voltage level of the specific pin to be high.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

### 13.3. AT@GPIOGET Get The Logical State of The Specific GPIO

#### AT@GPIOGET parameter and command syntax

Command	Possible response(s)
AT@GPIOGET=<pin>	<i>Normally respond:</i> @GPIOGET:<state> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@GPIOGET?	ERROR
AT@GPIOGET=?	@GPIOGET:(<pin>) OK

**Description:**

This command serves to get the state of the specific GPIO.

**Defined values:**

<pin>: integer, the specific pin to be controlled.

<state>: integer

0 – The voltage level of the specific pin is low.

1 – The voltage level of the specific pin is high.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

## 13.4. AT@GPIOSET Set The Logical State of The Specific GPIO

**AT@GPIOSET parameter and command syntax**

Command	Possible response(s)
AT@GPIOSET=<pin>,<state>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
AT@GPIOSET?	ERROR
AT@GPIOSET=?	@GPIOSET:(<pin>),(0-1) OK

**Description:**

This command serves to set the state of the specific GPIO.

**Defined values:**

<pin>: integer, the specific pin to be controlled.

<state>: integer

0 – Set the voltage level of the specific pin to be low.

1 – Set the voltage level of the specific pin to be high.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands.](#)

**Example:**

```
AT@INTERNET=1
OK

/* Enable GPIO_07 to be a GPIO. */
AT@GPIOREQ=1,7
OK

/* Configure GPIO_07 to be an output but forget to give a initial state.
An error code will be responded for warning. */
AT@GPIOCFG=7,1
@EXTERR:513

/* Configure GPIO_07 to be an output and initialize its logical level
to low. */
AT@GPIOCFG=7,1,0
OK

/* Check GPIO_07's state to make sure it is under logical level low
if necessary. */
AT@GPIOGET=7
@GPIOGET:0
OK
```

```

/* Set GPIO_07's logical level to be high. */
AT@GPIOSET=7,1
OK

/* Re-configure GPIO_07 to be an input pin. */
AT@GPIOCFG=7,0
OK

/* Try to set an input to be specific logical level and get a erroneous
response with failure code. */
AT@GPIOSET=7,1
@EXTERR:521

/* Try to get the logical level of an input. Respond it is logical high
now. */
AT@GPIOGET=7
@GPIOGET:1
OK

/* Release GPIO_07 when you don't need to control GPIO_07 any more.
Be careful, GPIO_07's state is unpredictable after being released. */
AT@GPIOREQ=0,7
OK

```

## 13.5. AT@THERMO Thermal Detection

### AT@THERMO parameter and command syntax

Command	Possible response(s)
AT@THERMO=<sensor_id>[,<threshold>]	<p><i>When the command is AT@THERMO=&lt;sensor&gt;</i></p> <p><i>Normally respond:</i></p> <p style="padding-left: 2em;">@THERMO:&lt;temperature&gt;</p> <p style="padding-left: 2em;">OK</p> <p><i>If something is wrong, then respond:</i></p>

	@EXTERR:<err_code>
<b>AT@THERMO?</b>	ERROR
<b>AT@THERMO=?</b>	@THERMO:(0-6)[,(<threshold>)] <sup>[**]</sup> OK or @THERMO:(0-5)[,(<threshold>)] <sup>[*]</sup> OK

### Description:

This command serves to query the temperature of the specific sensor or to set the threshold of the specific sensor for a notification.

### Defined values:

<sensor\_id><sup>[#1]</sup>: integer

- 0 – The first sensor on the module.
- 1 – The second sensor on the module.
- 2 – The third sensor on the module.
- 3 – The forth sensor on the module.
- 4 – The fifth sensor on the module.
- .....
- n – The n-th sensor on the module.

<temperature>: integer, current temperature in degree Celsius for the specific sensor.

<threshold><sup>[#2]</sup>: integer, the threshold to be monitored in degree Celsius.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Note #1:** The total number of sensors depends on platform, please check with WNC hardware for details.

**Note #2:** Reserved for future.

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:**

```
AT@INTERNET=1
OK

/* Read the first sensor embedded on a WNC data module. */
AT@THERMO=0
@THERMO:34
OK

/* Read the eighth sensor which doesn't exist on a WNC data module and
get an error code */
AT@THERMO=7
@EXTERR:513
```

## 13.6. AT@ADCOP Analog-to-Digital Converter Operation

### AT@ADCOP parameter and command syntax

Command	Possible response(s)
<code>AT@ADCOP=&lt;action&gt;[,&lt;freq uency&gt;]</code>	<p><i>When the command is AT@ADCOP=1</i></p> <p><i>Normally respond:</i></p> <p><code>@ADCOP:&lt;result&gt;</code></p> <p><code>OK</code></p> <p><i>If something is wrong, then respond:</i></p> <p><code>@EXTERR:&lt;err_code&gt;</code></p> <p><i>When the command is AT@ADCOP=1,&lt;frequency&gt;</i></p> <p><i>Normally respond:</i></p> <p><code>@ADCOP:&lt;result&gt;</code></p> <p><code>OK</code></p> <p><i>...&lt;frequency&gt; x 100ms later...</i></p> <p><code>@ADCOP:&lt;result&gt;</code></p>

	<p>...&lt;frequency&gt; x 100ms later...</p> <p>@ADCOP:&lt;result&gt;</p> <p>...&lt;frequency&gt; x 100ms later...</p> <p>@ADCOP:&lt;result&gt;</p>
	<p><i>If something is wrong, then respond:</i></p> <p>@EXTERR:&lt;err_code&gt;</p>
	<p><i>When the command is AT@ADCOP=0</i></p> <p><i>Normally respond:</i></p> <p>OK</p>
	<p><i>If something is wrong, then respond:</i></p> <p>@EXTERR:&lt;err_code&gt;</p>
<b>AT@ADCOP?</b>	ERROR
<b>AT@ADCOP=?</b>	<p>@ADCOP:(0-1)[,(0-100)]</p> <p>OK</p>

#### Description:

This command serves to start a measurement of AD converter.

#### Defined values:

<action>: integer

0 – Stop measuring.

1 – Start to measure.

<frequency><sup>[\*]</sup>: integer, the frequency of continuous report of measurements in 100 milliseconds. Range is from 1 to 100.

<result>: integer, the value of a measurement.

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTERR commands](#).

**Note:** \* indicates M14A2A only; \*\* indicates M18Q2 only

**Example:**

```
AT@INTERNET=1
OK

/* Read a measurement from the embedded voltage ADC on a WNC data module
and respond 1.414567 volt. */
AT@ADCOP=1
@ADCOP:1.414567
OK
```

## 14. Miscellaneous Commands

### 14.1. @EXTERR Response of the Proprietary AT Command for Errors

**@EXTERR parameter command syntax**

Command	Possible response(s)
	@EXTERR=<err_code>
<b>Reference:</b>	
<b>Note:</b>	Response

**Description:**

Response of proprietary AT command for errors

**Defined values:**

<err\_code>: integer, error code; refer to [Table B-1: Error codes supported for @EXTER commands](#)

## 14.2. @FUNEWIND Indicator for New Firmware

### Notification

@FUNEWIND parameter command syntax

Command	Possible response(s)
	@FUNEWIND:<file_size>
<b>Reference:</b>	
<b>Note:</b>	Unsolicited Response Message

#### Description:

An Indication to notify there is a new firmware to be installed.

#### Defined values:

<file\_size>: integer, the file size of the downloaded host firmware. If <file\_size> is 0, it means that the previous firmware is abandoned and state should be changed to initial value – 0.

## 14.3. @FUEXCIND Indication for Upgrade Availability

@FUEXCIND parameter command syntax

Command	Possible response(s)
	@FUEXCIND:<type>
<b>Reference:</b>	
<b>Note:</b>	Unsolicited Response Message

**Description:**

Command Indication for an indication that there an upgrade available

**Defined values:**

<type>: integer

0 – The module begin the upgrade process.

1 – The host should execute the upgrade process now.

## 14.4. @FUDONEIND Indication that the Module's Firmware Upgrade Process is Complete

**@FUDONEIND parameter command syntax**

Command	Possible response(s)
@FUDONEIND:<result>	
<b>Reference:</b>	
<b>Note:</b>	Unsolicited Response Message

**Description:**

Command Indication for notification that the module's firmware-upgrade process is complete.

**Defined values:**

<result>: integer  
0 – Completed with no errors  
1 – Failed; error number 1 (TBD)

## 14.5. AT@FUSENDSTATE State of the Upgrading Process

### Sent to the Module

#### AT@FUSENDSTATE parameter command syntax

Command	Possible response(s)
@ FUSENDSTATE =<state>	<i>Normally respond:</i> OK  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
@ FUSENDSTATE?	ERROR
@ FUSENDSTATE =?	@ FUSENDSTATE:(0-7) OK

#### Description:

Command Indication to notify that the module's firmware-upgrade process is complete.

#### Defined values:

<state>: integer  
0 – Initial value  
1 – Begin upgrading the firmware.  
2 – The firmware has updated successfully.  
3 – Not enough storage for the new firmware package  
4 – CRC check failure for the newly downloaded package

- 5 – Unsupported package type.
- 6 – Firmware update failed.
- 7 – Do not upgrade this firmware at this moment.

## 14.6. AT@FURECVFILE Receive the Firmware File Using HEX

### AT@FURECVFILE parameter command syntax

Command	Possible response(s)
<code>@FURECVFILE=&lt;offset&gt;,&lt;length&gt;</code>	<p><i>Normally respond:</i></p> <p><code>@FURECVFILE: &lt;hex_data&gt;</code></p> <p>OK</p> <p><i>If something is wrong, then respond:</i></p> <p><code>@EXTERR:&lt;err_code&gt;</code></p>
<code>@ FURECVFILE?</code>	ERROR
<code>@ FURECVFILE =?</code>	<code>@FURECVFILE:(&lt;offset&gt;),(1-1500)</code>

### Description:

Command for retrieving the content of the firmware from the module.

### Defined values:

`<offset>`: integer, the range is 0–(file\_size-1); offset of FW File.0

`<length>`: integer, data length of this transmission must be within a range of 1–1,500.

`<hex_data>`: string, maximal `<length>` bytes of data with binary-coded hexadecimal format which were received from the module. The external host processor side needs to convert the binary-coded hexadecimal format to original payload data (For example, `<hex_data>` which is a string “302A48D5” will be converted to be an array

which is 0x30 0x2A 0x48 0xD5 at the external host processor side).

## 14.7. AT@HOSTINFO Send the Host's information to the Module

### AT@HOSTINFO parameter command syntax

Command	Possible response(s)
@HOSTINFO=<ver_number>,<m anufacturer>,<model_name>,<m odel_id>	<i>Normally respond:</i>  <i>If something is wrong, then respond:</i> @EXTERR:<err_code>
@HOSTINFO?	ERROR
@HOSTINFO =?	@HOSTINFO:(<ver_number>),(<manufacturer>),(<m odel_name>),(<model_id>) OK

### Description:

Command sending the host's information to the module

### Defined values:

<ver\_number>: string, indicates the firmware version number of the host  
<manufacturer>: string, indicates the manufacturer of host  
<model\_name>: string, indicates the model name of host  
<model\_id>: string, indicates the model id of host

# 15 Short Messages Service

**Warning: This functionality is currently in beta.**

## 15.1 Introduction

In case of errors all the SMS related AT commands return the result codes defined in [Appendix A.2](#) instead of the usual error result codes listed in [Appendix A.1](#).

Parameter <index> description for ME (ME message), SM ((U)SIM message) and MT (ME + SM) memory cases:

- 0: SMS class 0 stored in RAM (the last one received).
- Values between 1 and 300: SMS stored in the ME message storage.
- Values between 301 and (301 + (n-1)): SMS stored in the SIM (n depends on the SIM card used).

TOBY-L200-00S / TOBY-L200-50S / TOBY-L210-00S / TOBY-L210-50S / MPC1-L200-00S / MPC1-L210-00S

The <index> parameter the range goes from 1 to n (n depends on the SIM Card used) and represents the index of SMS stored in the SIM.

The SMSes class 0 are not stored in RAM.

SARA-G300 / SARA-G310

The <index> parameter the range goes from 1 to n (n depends on the SIM Card used) and represents the index of SMS stored in the SIM.

Parameter <index> description for BM (Broadcast Message) memory case:

- LISA-U / SARA-U series - Values between 1 and 300: Cell Broadcast messages are stored only if there is at least an empty location available in the BM memory (that is located in the file system)
- SARA-G / LEON-G series - Values between 1 and 5: Cell Broadcast messages are stored using a circular buffer so they are always saved even if the BM memory (that is located in RAM) is full. Since the Cell Broadcast messages are stored in RAM, they will be lost after a power-off or reset of the module.

Parameter <index> description for SR (status Report) memory case:

- LISA-U / SARA-U series - Values between 1 and 300: Status Report messages are stored only if there is at least an empty location available in the SR memory (that is located in the file system).

The following limitations apply related to the SMS usage:

Single SMS

- 160 characters if <dcs> = "GSM 7 bit default alphabet data"
- 140 octets if <dcs> = "8-bit data"
- 70 UCS2 characters (2 bytes for each one) if <dcs>= "16-bit uncompressed UCS2 data"

Concatenated SMS (where supported) - "8-bit reference number" type

- 153 characters if <dcs> = "GSM 7 bit default alphabet data"
- 134 octets if <dcs> = "8-bit data"
- 67 UCS2 characters (2 bytes for each one) if <dcs>= "16-bit uncompressed UCS2 data"

Concatenated SMS (where supported) - "16-bit reference number" type

- The limits are the same as the "8-bit reference number" type, but are decreased by one unit  
A concatenated SMS can have as many as 255 parts.

For a complete overview of SMS, see the 3GPP TS 23.040 [\[8\]](#).

## 15.2 Select message service +CSMS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	-	+CMS Error

### 15.2.1 Description

Selects message service <service>. It returns the types of messages supported by the MT.

### 15.2.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSMS=<service>	+CSMS: <mt>,<mo>,<bm> OK	AT+CSMS=1 +CSMS: 1,1,1 OK
Read	AT+CSMS?	+CSMS: <service>,<mt>,<mo>,<bm> OK	+CSMS: 0,1,1,1 OK
Test	AT+CSMS=?	+CSMS: (list of supported <service>s) OK	+CSMS: (0-1) OK

### 15.2.3 Defined values

Parameter	Type	Description
<service>	Number	<ul style="list-style-type: none"><li>• 0: Refer to 3GPP TS 23.040 [8] and 3GPP TS 23.041 [9]; syntax of AT commands is compatible with 3GPP TS 27.005 [16] phase 2; phase 2+ features may be supported if no new command syntax is required</li><li>• 1: Refer to 3GPP TS 23.040 [8] and 3GPP TS 23.041 [9]; syntax of AT commands is compatible with 3GPP TS 27.005 [16] phase 2+</li></ul>
<mt>	Number	Mobile terminated messages <ul style="list-style-type: none"><li>• 0: not supported</li><li>• 1: supported</li></ul>
<mo>	Number	Mobile originated messages <ul style="list-style-type: none"><li>• 0: not supported</li><li>• 1: supported</li></ul>
<bm>	Number	Broadcast messages <ul style="list-style-type: none"><li>• 0: not supported</li><li>• 1: supported</li></ul>

### 15.2.4 Notes

- Set <service> to 1 to acknowledge an incoming message (either SMS or Status Report) with +CNMA command.
- If <service> is changed from 1 to 0 and one or more parameters of the +CNMI command are in phase 2+, switch the +CNMI parameters to phase 2 specific values before entering phase 2.

## 15.3 Preferred message storage +CPMS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	partial	Yes	NVM	No	Up to 3 min	+CMS Error

### 15.3.1 Description

Selects memory storages <mem1>, <mem2> and <mem3>. If the chosen storage is supported by the MT but not suitable, the +CMS ERROR: <err> error result code should be returned.

 See the test command for the supported memory types for each memory storage.

### 15.3.2 Syntax

Type	Syntax	Response	Example
Set	AT+CPMS=<mem1>[,<mem2>[,<mem3>]]	AT+CPMS: <used1>,<total1>,<used2>,<total2>,<used3>,<total3> OK	AT+CPMS="BM","SM","SM" +CPMS: 0,5,0,50,0,50 OK
Read	AT+CPMS?	+CPMS: <mem1>,<used1>,<total1>,<mem2>,<used2>,<total2>,<mem3>,<used3>,<total3> OK	+CPMS: "MT",4,350,"MT",4,350,"MT",4,350 OK
Test	AT+CPMS=?	+CPMS: (list of supported <mem1>s),(list of supported <mem2>s),(list of supported <mem3>s) OK	+CPMS: ("MT","ME","SM","BM","SR"),("MT","ME","SM"),("MT","ME","SM") OK

### 15.3.3 Defined values

Parameter	Type	Description
<mem1>	String	Memory used to read and delete messages. The supported values may vary: <ul style="list-style-type: none"> <li>"ME": ME message storage</li> <li>"SM": (U)SIM message storage</li> <li>"MT" (factory-programmed value): "ME"+"SM", "ME" preferred</li> <li>"BM": Broadcast Message storage</li> <li>"SR": Status Report storage</li> </ul> The default value is the currently set value.
<mem2>	String	Memory used to write and send SMS. The supported values may vary: <ul style="list-style-type: none"> <li>"ME": ME message storage</li> <li>"SM": (U)SIM message storage</li> <li>"MT" (factory-programmed value): "ME"+"SM", "ME" preferred</li> </ul> The default value is the currently set value.
<mem3>	String	Memory preferred to store the received SMS. The supported values may vary: <ul style="list-style-type: none"> <li>"ME": ME message storage</li> <li>"SM": (U)SIM message storage</li> <li>"MT" (factory-programmed value): "ME"+"SM", "ME" preferred</li> </ul> The default value is the currently set value.
<used1>	Number	Number of used message locations in <mem1>
<total1>	Number	Total number of message locations in <mem1>
<used2>	Number	Number of used message locations in <mem2>
<total2>	Number	Total number of message locations in <mem2>
<used3>	Number	Number of used message locations in <mem3>

Parameter	Type	Description
<total3>	Number	Total number of message locations in <mem3>

### 15.3.4 Notes

**TOBY-L200-00S / TOBY-L200-50S / TOBY-L210-00S / TOBY-L210-50S / MPCI-L200-00S / MPCI-L210-00S**

- Only "SM" message storage is supported.
- The factory-programmed value is "SM", "SM" and "SM".

**LEON-G**

- <mem1> = "SR" (Status Report storage) is not supported.

**SARA-G**

- <mem1> = "SR" (Status Report storage) is not supported.

**SARA-G300 / SARA-G310**

- "ME" and "MT" message storages are not supported.
- The factory-programmed value is "SM", "SM" and "SM".

## 15.4 Preferred message format +CMGF

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	<i>Profile</i>	No	-	+CMS Error

### 15.4.1 Description

Indicates to the MT which input and output format of messages shall be used.

### 15.4.2 Syntax

Type	Syntax	Response	Example
Set	AT+CMGF=[<mode>]	OK	AT+CMGF=1 OK
Read	AT+CMGF?	+CMGF: <mode> OK	+CMGF: 1 OK
Test	AT+CMGF=?	+CMGF: (list of supported <mode>s) OK	+CMGF: (0-1) OK

### 15.4.3 Defined values

Parameter	Type	Description
<mode>	Number	Indicates the format of messages used with send, list, read and write commands and URCs resulting from receiving SMSes messages: <ul style="list-style-type: none"> <li>• 0 (default and factory-programmed value): PDU mode</li> <li>• 1: text mode</li> </ul>

### 15.4.4 Notes

**TOBY-L201**

- The default value is 1 when the module is configured in Verizon mode ([+UMNOCONF=3](#)).

## 15.5 Save settings +CSAS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	No	NVM	No	-	+CMS Error

### 15.5.1 Description

Saves active message service settings from the current active memory (RAM) to non-volatile memory (NVM). The settings related to the +CSCA (the current SMSC address stored in RAM), +CSMP and +CSCB commands are stored in a specific SMS profile (only one profile is available).

### 15.5.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSAS[=<profile>]	OK	AT+CSAS
Test	AT+CSAS=?	+CSAS: (list of supported <profile>s) OK	+CSAS: (0) OK

### 15.5.3 Defined values

Parameter	Type	Description
<profile>	Number	Specific SMS profile index where to store the active message settings. The factory-programmed value is 0.

## 15.6 Restore settings +CRES

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 10 s	+CMS Error

### 15.6.1 Description

Restores message service settings from a non-volatile memory (NVM) to the current active memory (RAM). The settings related to the +CSCA (the SMSC address in the SIM card is also updated), +CSMP and +CSCB commands are read from a specific SMS profile (only one profile is available).

### 15.6.2 Syntax

Type	Syntax	Response	Example
Set	AT+CRES[=<profile>]	OK	AT+CRES=0
Test	AT+CRES=?	+CRES: (list of supported <profile>s) OK	+CRES: (0) OK

### 15.6.3 Defined values

Parameter	Type	Description
<profile>	Number	Specific SMS profile index from where to read the message service settings

## 15.7 Show text mode parameters +CSDH

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	-	+CMS Error

### 15.7.1 Description

Controls whether detailed SMS header information is shown in text mode (+CMGF=1).

This affects the responses of the +CMGR ([Chapter 11.11](#)), +CMGL ([Chapter 11.13](#)), +CSMP ([Chapter 11.17](#)), +CSCA ([Chapter 11.20](#)) AT commands and the +CMT, +CMTI, +CDS, +CDSI, +CBM, +CBMI ([Chapter 11.8](#)) URCs.

### 15.7.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSDH=<show>	OK	AT+CSDH=1 OK
Read	AT+CSDH?	+CSDH: <show> OK	+CSDH: 0 OK
Test	AT+CSDH=?	+CSDH: (list of supported <show>s) OK	+CSDH: (0-1) OK

### 15.7.3 Defined values

Parameter	Type	Description
<show>	Number	<ul style="list-style-type: none"><li>• 0 (default value and factory-programmed setting): do not show detailed SMS header information</li><li>• 1: show detailed SMS header information</li></ul>

## 15.8 New message indication +CNMI

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	partial	Yes	<a href="#">Profile</a>	No	-	+CMS Error

### 15.8.1 Description

Selects the procedure to indicate the reception of a new SMS in case of the MT is active (the DTR signal is ON). If the MT is inactive (the DTR signal is OFF), the message reception should be done as specified in 3GPP TS 23.038 [7].

- ☞ The SMSes of class 0 (normally displayed via MMI) are indicated on DTE via URC **+CMTI: "SM",0**, wherein 0 represents an SMS without SIM-storage ("SM" indicates only that no other specific setting is needed to read the SMS via [AT+CMGR=0](#)).
- ☞ The <tooa>, <fo>, <pid>, <dcs>, <sca>, <tosca>, <length> parameters in the text mode +CMT URC are displayed only if **+CSDH=1** is set.

The +UCMT URC notifies the SMS-DELIVER status for 3GPP2 Mobile Terminated SMSes; it is equivalent to +CMT but valid only for 3GPP2 SMS (i.e. 3GPP2 SMS over IMS received on Verizon MNO).

## 15.8.2 Syntax

Type	Syntax	Response	Example
Set	AT+CNMI=[<mode>[,<mt>[,<bm>[,<ds>[,<bfr>]]]]]	OK OK	AT+CNMI=1,1 OK
Read	AT+CNMI?	+CNMI: <mode>,<mt>,<bm>,<ds>,<bfr> OK	+CNMI: 0,0,0,0 OK
Test	AT+CNMI=?	+CNMI: (list of supported <mode>s),(list of supported <mt>s),(list of supported <bm>s),(list of supported <ds>s),(list of supported <bfr>s) OK	+CNMI: (0-2),(0-3),(0-2),(0-1) OK
URC		+CMTI: <mem>,<index>	+CMTI: "SM",5
URC		<b>Text mode (+CMGF=1):</b> +CMT: <oa>,[<alpha>],<scts>[,<tooa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>]<CR><LF><data>	+CMT: "+393475234652",,"14/11/21, 11:58:23+01"
		<b>PDU mode (+CMGF=0):</b> +CMT: ,<length><CR><LF><pdu>	Hello world
URC		<b>Text mode (+CMGF=1):</b> +UCMT: <message_id>,<oa>,<scts>,[<priority>],[<privacy>],[<callback_number>],<encoding>,[<status>],<num_sms>,<part>,<reference>],<length><CR><LF><text>	+UCMT: 1,+1231241241,"18:02:28+0 8"...,2,...,6
		<b>PDU mode (+CMGF=0):</b> +UCMT: <pdu_length><CR><LF><pdu>	Hello!
URC		+CBMI: <mem>,<index>	+CBMI: "BM",48
URC		<b>Text mode (+CMGF=1):</b> +CBM: <sn>,<mid>,<dcs>,<page>,<pages><CR><LF><data>	+CBM: 271,1025,1,1,1
		<b>PDU mode (+CMGF=0):</b> +CBM: <length><CR><LF><pdu>	The quick brown fox jumps over the lazy dog 0123456789
URC		+CDSI: <mem>,<index>	+CDSI: "MT",2
URC		<b>Text mode (+CMGF=1):</b> +CDS: <fo>,<mr>,[<ras>],[<tora>],<scts>,<dt>,<st>	+CDS: 6,202,"+393492323583",145, "14/07/25,13:07:16+02","14/07/25, 16:35:44+02",0
		<b>PDU mode (+CMGF=0):</b> +CDS: <length><CR><LF><pdu>	

## 15.8.3 Defined values

Parameter	Type	Description
<mode>	Number	Controls the processing of URCs specified within this command: <ul style="list-style-type: none"> <li>0 (default value): buffer URCs in the MT; if the MT buffer is full, the oldest indication may be discarded and replaced with the new received indications (ring buffer)</li> <li>1 (factory-programmed value): discard indication and reject new received message URCs when MT-DTE link is reserved; otherwise forward them directly to the DTE</li> <li>2: buffer URCs in the MT when the serial link is busy (e.g. data-transfer); otherwise forward them directly to the DTE</li> <li>3: forward URCs directly to the TE. TA-TE link specific inband technique used to embed result codes and data when MT is in on-line data mode</li> </ul>
<mt>	Number	Specifies the rules for managing the received SMS according the message's Data Coding Scheme (DCS): <ul style="list-style-type: none"> <li>0 (default value and factory-programmed value): No SMS-DELIVER indications are routed to the TE</li> </ul>

Parameter	Type	Description
		<ul style="list-style-type: none"> <li>• 1: if SMS-DELIVER is stored in the MT, indication of the memory location is routed to the DTE using the +CMTI URC</li> <li>• 2: SMS-DELIVER (except class 2 SMS) are routed directly to the DTE (but not saved in the module file system or SIM memory) using the +CMT URC. If MT has its own display device then class 0 SMS and SMS in the message waiting indication group (discard message) may be copied to both MT display and to DTE. In this case MT shall send the acknowledgement to the network. Class 2 SMSs and messages in the message waiting indication group (storage message) result in indication as defined in &lt;mt&gt;=1</li> <li>• 3: Class 3 SMS-DELIVERs are routed directly to DTE using URCs defined in &lt;mt&gt;=2. Messages of other data coding schemes result in indication as defined in &lt;mt&gt;=1</li> </ul>
<bm>	Number	Specifies the rules for managing the received Cell Broadcast messages (CBM): <ul style="list-style-type: none"> <li>• 0 (default value and factory-programmed value): no CBM indications to the DTE</li> <li>• 1: if the CBM is stored in the MT, an indication of the used memory location is routed to DTE using the +CBMI URC</li> <li>• 2: new CBMs are routed directly to the DTE using the +CBM URC</li> <li>• 3: class 3 CBMs are routed directly to DTE using URCs defined in &lt;bm&gt;=2. If CBM storage is supported, messages of other classes result in indication as defined in &lt;bm&gt;=1</li> </ul>
<ds>	Number	Specifies the rules for managing the Status Report messages: <ul style="list-style-type: none"> <li>• 0 (default value and factory-programmed value): no SMS-STATUS-REPORTs are routed to the DTE</li> <li>• 1: SMS-STATUS-REPORTs are routed to the DTE using the +CDS URC</li> <li>• 2: if SMS-STATUS-REPORT is stored in the MT, the indication of the memory location is routed to the DTE using the +CDSI URC</li> </ul>
<bfrr>	Number	Controls the buffering of URCs: <ul style="list-style-type: none"> <li>• 0 (default value and factory-programmed value): MT buffer of URCs defined within this command is flushed to the DTE when &lt;mode&gt; 1...3 is entered (OK final result code shall be given before flushing the codes).</li> <li>• 1: MT buffer of URCs defined within this command is cleared when &lt;mode&gt; 1...3 is entered</li> </ul>
<mem>	String	Same as defined in <a href="#">+CPMS Defined Values</a>
<index>	Number	Storage position
<length>	Number	Two meanings: <ul style="list-style-type: none"> <li>• in text mode: number of characters</li> <li>• in PDU mode: PDU's length in octets without the Service Center's address. In example: 0 39121430100038166F6000004E374F80D: this is a PDU with Service Center's number +1234, that generates the address 03912143 (4 octets). Thus in this case &lt;length&gt;=13.</li> </ul>
<pdu>	String	Protocol data unit: each 8-bit octet is presented as two IRA character long hexadecimal numbers, e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65)
<oa>	String	Originator address
<scts>	String	Service center time stamp in time-string format, see the <dt>
<data>	String	In the case of SMS: 3GPP TS 23.040 <a href="#">[8]</a> TP-User-Data in text mode responses; format: <ul style="list-style-type: none"> <li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 <a href="#">[7]</a> GSM 7 bit default alphabet is used and &lt;fo&gt; indicates that 3GPP TS 23.040 <a href="#">[8]</a> TP-User-Data-Header-Indication is not set: <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command Select TE Character Set +CSCS in 3GPP TS 27.007 <a href="#">[2]</a>): ME/TA converts GSM alphabet into current TE character set according to rules of Annex A</li> <li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number (e.g. character TODO: what character should go here? ( (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))</li> </ul> </li> <li>• if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used, or &lt;fo&gt; indicates that 3GPP TS 23.040 <a href="#">[8]</a> TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))</li> </ul> In the case of CBS: 3GPP TS 23.041 <a href="#">[9]</a> CBM Content of Message in text mode responses; format: <ul style="list-style-type: none"> <li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 <a href="#">[7]</a> GSM 7 bit default alphabet is used: <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command +CSCS in 3GPP TS 27.007 <a href="#">[2]</a>): ME/ TA converts GSM alphabet into current TE character set according to rules of Annex A</li> </ul> </li> </ul>

Parameter	Type	Description
		<ul style="list-style-type: none"> <li>o if TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number</li> <li>• if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number</li> </ul>
<sn>	Number	CBM serial number
<mid>	Number	CBM message identifier
<dcs>	Number	Data Coding Scheme
<page>	Number	CBM Page Parameter bits 4-7 in integer format as described in 3GPP TS 23.041 <a href="#">[9]</a>
<pages>	Number	CBM Page Parameter bits 0-3 in integer format as described in 3GPP TS 23.041 <a href="#">[9]</a>
<fo>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 <a href="#">[8]</a> )
<mr>	Number	Message reference
<ra>	String	Recipient address field
<tora>	Number	Type of address of <ra> - octet
<dt>	String	Discharge time in format "yy/MM/dd,hh:mm:ss+zz"; the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56
<st>	Number	Status of a SMS STATUS-REPORT
<message_id>	Number	Message-ID of the 3GPP2 SMS
<priority>	Number	3GPP2 priority: <ul style="list-style-type: none"> <li>• 0: normal</li> <li>• 1: interactive</li> <li>• 2: urgent</li> <li>• 3: emergency</li> </ul>
<privacy>	Number	3GPP2 privacy <ul style="list-style-type: none"> <li>• 0: not restricted</li> <li>• 1: restrictive</li> <li>• 2: confidential</li> <li>• 3: secret</li> </ul>
<callback_number>	String	Callback number
<encoding>	Number	Text encoding <ul style="list-style-type: none"> <li>• 2: ASCII7</li> <li>• 3: IA5</li> <li>• 4: UCS2</li> <li>• 8: ISO 8859-1</li> <li>• 9: GSM7</li> </ul>
<num_sms>	Number	Total number of SMS
<part>	Number	Fragment part number
<reference>	Number	3GPP2 reference ID

#### 15.8.4 Notes

- The incoming SMS/CBM URC indications will be displayed only on the AT interface where the last +CNMI command was set. As a general rule, the command should be issued by the DTE:
  - o After start-up
  - o After using the **Z** and **&F** command (which reset the command configuration)
  - o Whenever the incoming SMS URCs indications are requested on a different AT interface
- When <m1> is not set to 0 the arrival of an SMS is notified by switching the RI line from OFF to ON for 1 s. This is done in respect to the RI line of all the AT interface
- The behaviour described in the note above can be configured via the **+UDCONF=82** AT command (where this command is supported).

#### TOBY-L2 / MPC-L2

- The RI line switching from OFF to ON for 1 s is only performed on the AT interface where the +CNMI command is issued (with <m1> not set to 0).
- <mode> = 3 is not supported.
- <bm> = 1 and <bm> = 3 are not supported.

- <ds> = 2 is not supported.

#### SARA-G / LEON-G / LISA-U / SARA-U

- <mode> = 3 is not supported.
- The +UCMT URC is not supported.

## 15.9 Incoming SMS/CBM indication via different AT interfaces +UDCONF=82

+UDCONF=82						
Modules	LISA-U200-03S LISA-U200-83S LISA-U201 SARA-U260-03S SARA-U270-03S SARA-U270-53S SARA-U280-03S					
Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	No	No	No	-	+CME Error

### 15.9.1 Description

Allows the module to provide SMS/CBM indications on different AT command interfaces: the incoming SMS/CBM URC indications will be displayed on each AT command interface where the command [+CNMI](#) is issued.

When the URC indications are disabled, that is <mode> parameter of [+CNMI](#) equals to 0 or one (or more) of the +CNMI parameters <mt>, <bm>, <ds> equals 0, they are removed from all the AT terminals

The behaviour regarding the [+CNMI](#) values loaded from the module [Profile](#), during start-up phase and by using [Z&F](#) AT commands, remains unchanged.

### 15.9.2 Syntax

Type	Syntax	Response	Example
Set	AT+UDCONF=82,<CNMI_conf_status>	OK	AT+UDCONF=82,0 OK
Read	AT+UDCONF=82	+UDCONF: 82,<CNMI_conf_status> OK	AT+UDCONF=82 +UDCONF: 82,1 OK

### 15.9.3 Defined values

Parameter	Type	Description
<CNMI_conf_status>	Number	Enables / disables the incoming SMS/CBM indication via different AT command interfaces. Allowed values: <ul style="list-style-type: none"> <li>• 0 (factory-programmed value): the incoming SMS/CBM URC indications will be displayed only on the AT interface where the last <a href="#">+CNMI</a> command was issued</li> <li>• 1: the incoming SMS/CBM indications via different AT interfaces is enabled. The URC about the incoming SMS/CBM indications will be displayed on each AT interface where the command <a href="#">+CNMI</a> was issued.</li> </ul>

## 15.10 Select service for MO SMS messages +CGSMS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	No	<a href="#">NVM</a>	No	-	+CME Error

### 15.10.1 Description

Specifies the service (PS or CS) or service preference that the MT will use to send MO SMS messages.

In particular:

- in 2G RAT, PS service means GPRS and CS service means transmission on GSM dedicated channels;
- in 3G RAT, PS service means transmission on PS domain SRB (Signalling Radio Bearer) and CS service means transmission on CS domain SRB; SRB can be mapped to several UMTS transport channels, e.g. RACH/FACH or DCH;
- in 4G RAT, PS service means IMS messaging on EPS bearers and CS service means transmission on SGs (Signalling Gateways).

## 15.10.2 Syntax

Type	Syntax	Response	Example
Set	AT+CGSMS=[<service>]	OK	AT+CGSMS=1 OK
Read	AT+CGSMS?	+CGSMS: <service> OK	+CGSMS: 1 OK
Test	AT+CGSMS=?	+CGSMS: (list of supported <service>s) OK	+CGSMS: (0-3) OK

## 15.10.3 Defined values

Parameter	Type	Description
<service>	Number	Service or service preference to be used: <ul style="list-style-type: none"> <li>• 0 (default value): PS</li> <li>• 1 (factory-programmed value): CS</li> <li>• 2: PS preferred (use CS if PS is not available)</li> <li>• 3: CS preferred (use PS if CS is not available)</li> </ul>

## 15.11 Read message +CMGR

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min (<1 s for prompt ">" when present)	+CMS Error

### 15.11.1 Description

Returns the message with location value <index> from message storage <mem1> to the DTE.

- ☞ The parameters <tooa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>,<cdata> shall be displayed only if [+CSDH=1](#) is set.
- ☞ The syntax AT+CMGR=0 allows to display an SMS class 0 if it is signalized to MT, because no MMI is available in the MT (see also the note from command [+CNMI](#)).
- ☞ If the <index> value is out of range (it depends on [AT+CPMS](#) command setting) or it refers to an empty position, then "+CMS ERROR: invalid memory index" error result code is returned.

## 15.11.2 Syntax

Type	Syntax	Response	Example
Set	<b>Text mode (+CMGF=1):</b> AT+CMGR=<index>	<b>(SMS-DELIVER)</b>	AT+CMGR=303 +CMGR: "REC READ", "+393488535999",,"07/04/05,18:0

Type	Syntax	Response	Example
		+CMGR: <stat>,<oa>,[<alpha>],<scts>[<tooa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>] <data>	2:28+08",145,4,0,0,"+393492000466", 145,93 You have a missed called. Free information provided by your operator.
		OK	OK
		<b>(SMS-SUBMIT)</b> +CMGR: <stat>,<da>,[<alpha>][,<toda>,<fo>,<pid>,<dcs>,[<vp>],<sca>,<tosca>,<length>] <data>	
		OK	
		<b>(SMS-STATUS-report)</b> +CMGR: <stat>,<fo>,<mr>,[<ra>],[<tora>],<scts>,<dt>,<st>	
		OK

### 15.11.3 Defined values

Parameter	Type	Description
<index>	Number	Storage position
<stat>	Number	<ul style="list-style-type: none"> <li>• 0: in PDU mode or "REC UNREAD" in text mode: received unread SMS</li> <li>• 1: in PDU mode or "REC READ" in text mode: received read SMS</li> <li>• 2: in PDU mode or "STO UNSENT" in text mode: stored unsent SMS</li> <li>• 3: in PDU mode or "STO SENT" in text mode: stored sent SMS</li> </ul>
<oa>	String	Originator address
<alpha>	String	Alphanumeric representation of <da> or <a> corresponding to the entry found in the phonebook 3GPP TS 24.008 [12]. The parameter is not managed.
<scts>	String	Service center time stamp in time-string format, see <dt>
<tooa>	Number	Type of address of <oa> - octet
<fo>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 [8])
<pid>	Number	TP-Protocol-Identifier (default 0); see the 3GPP TS 23.040 [8]
<dcs>	Number	Data Coding Scheme
<sca>	String	Service center address field
<tosca>	Number	Type of address of <sca> - octet in Number format (for more details see the 3GPP TS 24.008 [12]); default 145 when string includes '+', otherwise default 129
<length>	Number	<p>Two meanings:</p> <ul style="list-style-type: none"> <li>• in text mode: number of characters</li> </ul>

Parameter	Type	Description										
		<ul style="list-style-type: none"> <li>in PDU mode: PDU's length in octets without the Service Center's address. In example 039121430100038166F6000004E374F80D: this is a PDU with Service Center's number +1234, that generates the address 03912143 (4 octets). Thus in this case &lt;length&gt; = 13.</li> </ul>										
<data>	String	<p>In the case of SMS: 3GPP TS 23.040 [8] TP-User-Data in text mode responses; format:</p> <ul style="list-style-type: none"> <li>if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used and &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is not set: <ul style="list-style-type: none"> <li>if TE character set other than "HEX" (see <a href="#">+CSCS</a> command description): ME/TA converts GSM alphabet into current TE character set according to rules of Annex A</li> <li>if TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number (e.g. character TODO: what character should go here? (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))</li> </ul> </li> <li>if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used, or &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))</li> </ul> <p>In the case of CBS: 3GPP TS 23.041 [9] CBM Content of Message in text mode responses; format:</p> <ul style="list-style-type: none"> <li>if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used: <ul style="list-style-type: none"> <li>if TE character set other than "HEX" (see <a href="#">+CSCS</a> command description): ME/TA converts GSM alphabet into current TE character set according to rules of Annex A</li> <li>if TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number</li> </ul> </li> <li>if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number</li> </ul>										
<da>	String	Destination address										
<toda>	Number	Type of address of <da> - octet										
<vp>	Number	Format depending of the <fo> setting: <ul style="list-style-type: none"> <li>Relative format: validity period starting from when the SMS is received by the SMSC, in range 0-255 (default value 167); for more details see the 3GPP TS 23.040 [8]</li> </ul> <table> <thead> <tr> <th>&lt;vp&gt;</th> <th>Validity period value</th> </tr> </thead> <tbody> <tr> <td>0 to 143</td> <td>(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)</td> </tr> <tr> <td>144 to 167</td> <td>12 hours + ((TP-VP - 143) x 30 minutes)</td> </tr> <tr> <td>168 to 196</td> <td>(TP-VP - 166) x 1 day</td> </tr> <tr> <td>197 to 255</td> <td>(TP-VP - 192) x 1 week</td> </tr> </tbody> </table> <ul style="list-style-type: none"> <li>Absolute format: absolute time of the validity period termination in string format ("yy/MM/dd, hh:mm:ss+zz") (see the 3GPP TS 23.040 [8]); the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56</li> </ul>	<vp>	Validity period value	0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)	144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)	168 to 196	(TP-VP - 166) x 1 day	197 to 255	(TP-VP - 192) x 1 week
<vp>	Validity period value											
0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)											
144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)											
168 to 196	(TP-VP - 166) x 1 day											
197 to 255	(TP-VP - 192) x 1 week											
<mr>	Number	Message reference										
<ra>	String	Recipient address field										
<tora>	Number	Type of address of <ra> - octet										
<dt>	String	Discharge time in format "yy/MM/dd,hh:mm:ss+zz"; the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56										
<st>	Number	Status of an SMS STATUS-REPORT										
<ct>	Number	TP-Command-Type (default 0)										
<mn>	Number	See the 3GPP TS 23.040 [8] TP-Message-Number in integer format										
<cdata>	String	TP-Command-Data in text mode responses										
<sn>	Number	CBM serial number										
<mid>	Number	CBM message identifier										
<page>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 4-7 in integer format										
<pages>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 0-3 in integer format										
<pdu>	String	Protocol data unit: each 8-bit octet is presented as two IRA character long hexadecimal numbers, e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65)										

## 15.12 New message acknowledgement to MT +CNMA

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 150 s	+CMS Error

### 15.12.1 Description

Confirms the reception of a new message (SMS-DELIVER or SMS-STATUS-REPORT) which is routed directly to the TE (see the [+CNMI](#) command). This acknowledgement command shall be used when [+CSMS](#) parameter <service> equals 1. The MT shall not send another +CMT or +CDS (see the [+CNMI](#) command) unsolicited result codes to the TE before the previous one is acknowledged. If the MT does not get acknowledgement within required time (network timeout), the MT should respond as specified in 3GPP TS 24.011 [\[13\]](#) to the network. The MT shall automatically disable routing to the TE by setting both <m1> and <d1> values of [+CNMI](#) to zero. If the command is executed, but no acknowledgement is expected, or some other MT related error occurs, the final result code +CMS ERROR: <err> is returned.

In PDU mode, it is possible to send either positive (RP-ACK) or negative (RP-ERROR) acknowledgement to the network. The <n> parameter defines which one will be sent. Optionally (when <length> is greater than zero) an acknowledgement TPDU (SMS-DELIVER-REPORT for RP-ACK or RP-ERROR) may be sent to the network. The entering of PDU is done similarly as specified in [+CMGS](#) command, except that the format of <ackpdu> is used instead of <pdu> (i.e. SMSC address field is not present). The PDU shall not be bounded by double quotes.

### 15.12.2 Syntax

Type	Syntax	Response	Example
Set	Text mode (+CMGF=1): AT+CNMA	OK	AT+CNMA
	PDU mode (+CMGF=0): AT+CNMA[=<n>[,<length>] [PDU is given<Ctrl-Z>/<ESC>>]]]	OK	AT+CNMA=1,5 >000700000 <Ctrl-Z> OK
Test	AT+CNMA=?	Text mode (+CMGF=1): OK PDU mode (+CMGF=0): +CNMA: (list of supported <n>s) OK	OK +CNMA: (0-2) OK

### 15.12.3 Defined values

Parameter	Type	Description
<n>	Number	<ul style="list-style-type: none"> <li>• 0: the command operates similarly as defined for the text mode</li> <li>• 1: sends RP-ACK (or buffered result code received correctly)</li> <li>• 2: sends RP-ERROR (if PDU is not given, ME/TA shall send SMS-DELIVER-REPORT with 3GPP TS 23.040 <a href="#">[8]</a> TP-FCS value set to 'FF' (unspecified error cause))</li> </ul>
<length>	Number	PDU's length in octets without the Service Center's address

## 15.13 List message +CMGL

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	<i>Up to 3 min (&lt;1 s for prompt "&gt;" when present)</i>	+CMS Error

### 15.13.1 Description

Returns SMS messages with status value <stat> from message storage <mem1> to the DTE. Some are displayed only when setting +CSDH=1 (see +CSDH, [Chapter 11.7](#)). If status of the received message is "received unread", status in the storage changes to "received read".

### 15.13.2 Syntax

Type	Syntax	Response	Example
Set	Text mode (+CMGF=1): AT+CMGL[=<stat>]	Command successful and SMS-DELIVERS: AT+CMGL +CMGL: <index>,<stat>,<oa>,[<alpha>], [<scts>][,<tooa>,<length>] <data> [+CMGL: <index>,<stat>,<oa>, [<alpha>],[<scts>][,<tooa>,<length>]<data>[...]] OK	Command successful and SMS-DELIVERS: +CMGL: 303,"REC READ ", "+393401234999", "08/08/06,10:01:38+08" You have a missed called. Free information provided by your operator. OK
		Command successful and SMS-SUBMITs: +CMGL: <index>,<stat>,<da>,[<alpha>], [<toda>,<length>] <data> [+CMGL: <index>,<stat>,<da>, [<alpha>],[<toda>,<length>]<data>[...]] OK	Command successful and SMS-SUBMITs: +CMGL: <index>,<stat>,<da>,[<alpha>],[<toda>,<length>]<data>[...]] OK
		Command successful and SMS-STATUS-REPORTs: +CMGL: <index>,<stat>,<fo>,<mr>,[<ra>],[<tora>],<scts>,<dt>,<st> [+CMGL: <index>,<stat>,<fo>,<mr>,[<ra>],[<tora>],<scts>,<dt>,<st> [...]] OK	Command successful and SMS-STATUS-REPORTs: +CMGL: <index>,<stat>,<fo>,<mr>,[<ra>],[<tora>],<scts>,<dt>,<st> [...]] OK
		Command successful and SMS-COMMANDs: +CMGL: <index>,<stat>,<fo>,<ct> [+CMGL: <index>,<stat>,<fo>,<ct>[...]] OK	Command successful and SMS-COMMANDs: +CMGL: <index>,<stat>,<fo>,<ct> [+CMGL: <index>,<stat>,<fo>,<ct>[...]] OK
		Command successful and CBM storage: +CMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages><data> [+CMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages>,<data>[...]] OK	Command successful and CBM storage: +CMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages><data> [+CMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages>,<data>[...]] OK
PDU mode (+CMGF=0):		Command successful:	AT+CMGL=1

Type	Syntax	Response	Example
	AT+CMGL[=<stat>]	+CMGL: <index>,<stat>,[<alpha>],<length><pdu>[+CMGL: <index>,<stat>,[<alpha>],<length>]<pdu> [...]	+CMGL: 305,1,,57 079193432900 1185440ED0D637396C7EBBCB000090 9092708024802A050003000303DEA0 584CE60205D974791994769BDF3A90 DB759687E9F534FD0DA2C9603419 OK
Test	AT+CMGL=?	+CMGL: (list of supported <stat>s) OK	+CMGL: ("REC UNREAD","REC READ", "STO UNSENT","STO SENT","ALL") OK

### 15.13.3 Defined values

Parameter	Type	Description
<stat>	Number or String	Number type in PDU mode (default value: 4), or string type in text mode (default value: "ALL"); indicates the status of message in memory <ul style="list-style-type: none"> <li>• 0: in PDU mode or "REC UNREAD" in text mode: received unread SMS messages</li> <li>• 1: in PDU mode or "REC READ" in text mode: received read SMS messages</li> <li>• 2: in PDU mode or "STO UNSENT" in text mode: stored unsent SMS messages</li> <li>• 3: in PDU mode or "STO SENT" in text mode: stored sent SMS messages</li> <li>• 4: in PDU mode or "ALL" in text mode: all SMS messages</li> </ul>
<index>	Number	Storage position
<oa>	String	Originator address
<alpha>	String	Alphanumeric representation of <da> or <a> corresponding to the entry found in the phonebook 3GPP TS 24.008 [12]. The parameter is not managed.
<scts>	String	Service center time stamp in time-string format; refer to <dt>
<tooa>	Number	Type of address of <oa> - octet
<length>	Number	Two meanings: <ul style="list-style-type: none"> <li>• in text mode: number of characters</li> <li>• in PDU mode: PDU's length in octets without the Service Center's address. In example 039121430100038166F6000004E374F80D: this is a PDU with Service Center's number +1234, that generates the address 03912143 (4 octets). Thus in this case &lt;length&gt; = 13.</li> </ul>
<data>	String	This is the TP-User-Data in text mode; the decoding depends on the DCS (Data Coding Scheme) and the FO (First Octect) of the SMS header 3GPP TS 23.040 [8]; format: <ul style="list-style-type: none"> <li>• if DCS indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used and FO indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is not set: <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command Select TE Character Set +CSCS in 3GPP TS 27.007 [2]): ME/TA converts GSM alphabet into current TE character set according to rules of Annex A</li> <li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number (e.g. character TODO: what character should go here? (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))</li> </ul> </li> <li>• if DCS indicates that 8-bit or UCS2 data coding scheme is used, or FO indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))</li> </ul> In the case of CBS: 3GPP TS 23.041 [9] CBM Content of Message in text mode responses; format: <ul style="list-style-type: none"> <li>• if DCS indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used: <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command +CSCS in 3GPP TS 27.007 [2]): ME/TA converts GSM alphabet into current TE character set according to rules of Annex A</li> <li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number</li> </ul> </li> </ul> if DCS indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number
<da>	String	Destination address
<toda>	Number	Type of address of <da> - octet
<fo>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 [8])

Parameter	Type	Description
<mr>	Number	Message reference
<ra>	String	Recipient address field
<tora>	Number	Type of address of <ra> - octet
<dt>	String	Discharge time in format "yy/MM/dd,hh:mm:ss+zz"; the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56
<st>	Number	Status of an SMS STATUS-REPORT
<cct>	Number	TP-Command-Type (default 0)
<sn>	Number	CBM serial number
<mid>	Number	CBM message identifier
<page>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 4-7 in integer format
<pages>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 0-3 in integer format
<pdu>	String	Protocol data unit: each 8-bit octet is presented as two IRA character long hexadecimal numbers, e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65)
<dcs>	Number	Data Coding Scheme

## 15.14 Send message +CMGS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min (<1 s for prompt ">" when present)	+CMS Error

### 15.14.1 Description

Sends a message from a DTE to the network (SMS-SUBMIT). The message reference value <mr> is returned to the DTE for a successful message delivery. <Ctrl-Z> indicates that the SMS shall be sent, while <ESC> indicates aborting of the edited SMS.

 The entered text/PDU is preceded by a ">" (Greater-Than sign) character, and this indicates that the interface is in "text/PDU enter" mode. The DCD signal shall be in ON state while the text/PDU is entered.

### 15.14.2 Syntax

Type	Syntax	Response	Example
Set	Text mode (+CMGF=1): AT+CMGS=<da>[,<toda>]<CR> text is entered<Ctrl-Z/ESC>	+CMGS: <mr> OK	AT+CMGS="0171112233"<CR> > This is the text<Ctrl-Z> +CMGS:2 OK
	PDU mode (+CMGF=0): AT+CMGS=<length><CR> PDU is given<Ctrl-Z/ESC>	+CMGS: <mr> OK	AT+CMGS=13<CR> > 039121430100038166F600000 4E374F80D<Ctrl-Z> +CMGS:2 OK
Test	AT+CMGS=?	OK	

### 15.14.3 Defined values

Parameter	Type	Description
<da>	String	Destination address
<toda>	Number	Type of address of <da> - octet
<text>	String	SMS String

Parameter	Type	Description
<stat>	Number or String	Number type in PDU mode (default value: 2), or string type in text mode (default value: "STO UNSENT"); indicates the status of message in memory <ul style="list-style-type: none"> <li>• 0: in PDU mode or "REC UNREAD" in text mode: received unread SMS messages</li> <li>• 1: in PDU mode or "REC READ" in text mode: received read SMS messages</li> <li>• 2: in PDU mode or "STO UNSENT" in text mode: stored unsent SMS messages</li> <li>• 3: in PDU mode or "STO SENT" in text mode: stored sent SMS messages</li> </ul>
<text>	String	SMS String
<index>	Number	Storage position
<length>	Number	Two meanings: <ul style="list-style-type: none"> <li>• in text mode: number of characters</li> <li>• in PDU mode: PDU's length in octets without the Service Center's address. In example: 0 39121430100038166F600004E374F80D is a PDU with Service Center's number +1234, that generates the address 03912143 (4 octets). Thus in this case &lt;length&gt;=13.</li> </ul>
<PDU>	String	Protocol Data Unit: each 8-bit octet of the PDU must be written as two IRA character long hexadecimal numbers, e.g. octet with integer value 42 must be written as two characters 2A (IRA 50 and 65)

## 15.15 Write message to memory +CMGW

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	<10 s	+CMS Error

### 15.15.1 Description

Stores a message (SMS-DELIVER or SMS-SUBMIT) to memory storage <mem2> and returns the memory location <index> of the stored message. <Ctrl-Z> indicates that the SMS shall be stored, while <ESC> indicates aborting of the edited SMS.

 The entered text/PDU is preceded by a ">" (Greater-Than sign) character, and this indicates that the interface is in "text/PDU enter" mode. The DCD signal shall be in ON state while the text/PDU is entered.

### 15.15.2 Syntax

Type	Syntax	Response	Example
Set	Text mode (+CMGF=1): AT+CMGW[=<oa/da>[,<tooa/toda>[,<stat>]]]<CR> text is entered<Ctrl-Z/ESC>	+CMGW: <index> OK OK	AT+CMGW="091137880"<CR> > This is the text<Ctrl-Z> +CMGW:303 OK
	PDU mode (+CMGF=0): AT+CMGW=<length>[,<stat>]<CR> PDU is given<Ctrl-Z/ESC>	+CMGW: <index> OK OK	AT+CMGW=13<CR> > 039121430100038166F600000 4E374F80D<Ctrl-Z> +CMGW:303 OK
Test	AT+CMGW=?	OK	

### 15.15.3 Defined values

Parameter	Type	Description
<da>	String	3GPP TS 23.040 [3] TP-Destination-Address Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set (refer command +CSCS in 3GPP TS 27.007 [9]); type of address given by <toda>
<oa>	String	3GPP TS 23.040 [8] TP-Originating-Address Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set (refer command +CSCS in 3GPP TS 27.007 [2]); type of address given by <tooa>
<tooa>	Number	3GPP TS 24.011 [13] TP-Originating-Address Type-of-Address octet in integer format (default value: refer to <toda>)
<toda>	Number	3GPP TS 24.011 [13] TP-Destination-Address Type-of-Address octet in integer format (when first character of <da> is + (IRA 43) default is 145, otherwise default is 129)
<stat>	Number or String	Number type in PDU mode (default value: 2), or string type in text mode (default value: "STO UNSENT"); indicates the status of message in memory <ul style="list-style-type: none"> <li>• 0: in PDU mode or "REC UNREAD" in text mode: received unread SMS messages</li> <li>• 1: in PDU mode or "REC READ" in text mode: received read SMS messages</li> <li>• 2: in PDU mode or "STO UNSENT" in text mode: stored unsent SMS messages</li> <li>• 3: in PDU mode or "STO SENT" in text mode: stored sent SMS messages</li> </ul>
<text>	String	SMS String
<index>	Number	Storage position
<length>	Number	Two meanings: <ul style="list-style-type: none"> <li>• in text mode: number of characters</li> <li>• in PDU mode: PDU's length in octets without the Service Center's address. In example: 0 39121430100038166F6000004E374F80D is a PDU with Service Center's number +1234, that generates the address 03912143 (4 octets). Thus in this case &lt;length&gt;=13.</li> </ul>
<PDU>	String	Protocol Data Unit: each 8-bit octet of the PDU must be written as two IRA character long hexadecimal numbers, e.g. octet with integer value 42 must be written as two characters 2A (IRA 50 and 65)

## 15.16 Send message from storage +CMSS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min (<1 s for prompt ">" when present)	+CMS Error

### 15.16.1 Description

Sends message with location value <index> from the preferred message storage <mem2> to the network (SMS-SUBMIT or SMS-COMMAND). If a new recipient address <da> is given for SMS-SUBMIT, it will be used instead of the one stored with the message. Reference value <mr> is returned to the DTE on successful message delivery.

### 15.16.2 Syntax

Type	Syntax	Response	Example
Set	Text mode (+CMGF=1): AT+CMSS=<index>[,<da>[,<toda>]]	+CMSS: <mr> OK	AT+CMSS=302 +CMSS: 3 OK
	PDU mode (+CMGF=0): AT+CMSS=<index>	+CMSS: <mr> OK	AT+CMSS=302 +CMSS: 4 OK
Test	AT+CMSS=?	OK	

### 15.16.3 Defined values

Parameter	Type	Description
<index>	Number	Storage position
<da>	String	Destination address
<toda>	Number	Type of address of <da> - octet
<mr>	Number	Message reference

## 15.17 Set text mode parameters +CSMP

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 10 s	+CMS Error

### 15.17.1 Description

Selects values for additional parameters needed when an SMS is sent to the network or placed in a storage when text format message mode is selected. For more details see the 3GPP TS 23.038 [7] and the 3GPP TS 23.040 [8].

### 15.17.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSMP=<fo>,<vp>[,<pid>[,<dcs>]]	OK	AT+CSMP=17,167,0,0 OK
Read	AT+CSMP?	+CSMP: <fo>,<vp>,<pid>,<dcs>	+CSMP: 17,167,0,0
Test	AT+CSMP=?	OK	OK

### 15.17.3 Defined values

Parameter	Type	Description															
<fo>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 [8])															
<vp>	Number	Format depending on the values of the bit3/bit4 of the <fo> (SMS-SUBMIT case):  <table border="1"><tr><td>bit 3</td><td>bit 4</td><td>Format</td></tr><tr><td>0</td><td>0</td><td>Validity period not present</td></tr><tr><td>0</td><td>1</td><td>Validity period present, relative format</td></tr><tr><td>1</td><td>0</td><td>Reserved</td></tr><tr><td>1</td><td>1</td><td>Validity period present, absolute format</td></tr></table>	bit 3	bit 4	Format	0	0	Validity period not present	0	1	Validity period present, relative format	1	0	Reserved	1	1	Validity period present, absolute format
bit 3	bit 4	Format															
0	0	Validity period not present															
0	1	Validity period present, relative format															
1	0	Reserved															
1	1	Validity period present, absolute format															
		<ul style="list-style-type: none"><li>Relative format: validity period, counted from when the SMS-SUBMIT is received by the SMSC, in range 0-255 (the default value is 167); for more details see the 3GPP TS 23.040 [8]</li></ul>															
		<table border="1"><tr><td>&lt;vp&gt;</td><td>Validity period value</td></tr><tr><td>0 to 143</td><td>(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)</td></tr><tr><td>144 to 167</td><td>12 hours + ((TP-VP - 143) x 30 minutes)</td></tr><tr><td>168 to 196</td><td>(TP-VP - 166) x 1 day</td></tr><tr><td>197 to 255</td><td>(TP-VP - 192) x 1 week</td></tr></table>	<vp>	Validity period value	0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)	144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)	168 to 196	(TP-VP - 166) x 1 day	197 to 255	(TP-VP - 192) x 1 week					
<vp>	Validity period value																
0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)																
144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)																
168 to 196	(TP-VP - 166) x 1 day																
197 to 255	(TP-VP - 192) x 1 week																
		<ul style="list-style-type: none"><li>Absolute format: absolute time of the validity period termination in string format ("yy/MM/dd, hh:mm:ss+zz") (see the 3GPP TS 23.040 [8]); the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56</li></ul>															
<pid>	Number	TP-Protocol-Identifier (default value: 0); see the 3GPP TS 23.040 [8]															
<dcs>	Number	Data Coding Scheme. The default value is 0															

### 15.17.4 Notes

#### TOBY-L2 / MPC-L2

- The absolute format of the validity period is not supported.

## 15.18 Delete message +CMGD

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	partial	Yes	No	No	< 55 s	+CMS Error

### 15.18.1 Description

Deletes the message from the preferred message storage <mem1>, if <flag> = 0 or not present, in location <index>. Otherwise the messages are deleted following the rules specified by <flag>.

- 👉 When deleting a message from an empty location, the module returns "OK".
- 👉 If the <index> value is out of range (it depends on AT+CPMS command setting), then the error "+CMS ERROR: invalid memory index" is returned.

### 15.18.2 Syntax

Type	Syntax	Response	Example
Set	AT+CMGD=<index>[,<flag>]	OK OK	AT+CMGD=3 OK
Test	AT+CMGD=?	+CMGD: (list of supported <index>s),(list of supported <flag>s)	+CMGD: (1-350),(0-4) OK

### 15.18.3 Defined values

Parameter	Type	Description
<index>	Number	Storage position
<flag>	Number	Deletion flag. If present, and different from 0, <index> is ignored: <ul style="list-style-type: none"><li>• 0 (default value): delete the message specified in &lt;index&gt;</li><li>• 1: delete all the read messages from the preferred message storage, leaving unread messages and stored mobile originated messages (whether sent or not) untouched</li><li>• 2: delete all the read messages from the preferred message storage and sent mobile originated messages, leaving unread messages and unsent mobile originated messages untouched</li><li>• 3: delete all the read messages from the preferred message storage, sent and unsent mobile originated messages leaving unread messages untouched</li><li>• 4: delete all the messages from the preferred message storage including unread messages</li></ul>

### 15.18.4 Notes

#### SARA-G / LEON-G

- The "BM" memory entries cannot be deleted.

## 15.19 Primary notification event reporting +CPNER

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	No	No	No	-	+CME Error

### 15.19.1 Description

Configures the reporting of primary notification events when received from the network. Primary notification events are used for Public Warning Systems like ETWS (Earthquake and Tsunami Warning Systems).

- 👉 The UE will discard the duplicate primary notification.
- 👉 The notification is considered a duplicate if it has equal <message\_identifier> and <serial\_number> and arrives from the same PLMN. A primary notification message stored to detect duplication is automatically cleared after three hours of not receiving any message.

### 15.19.2 Syntax

Type	Syntax	Response	Example
Set	AT+CPNER=<reporting>	OK	AT+CPNER=1 OK
Read	AT+CPNER?	+CPNER: <reporting>	+CPNER: 1 OK
Test	AT+CPNER=?	+CPNER: (list of supported <reporting>s)	+CPNER: (0-1) OK
URC		+CPNERU: <message_identifier>,<serial_number>,<warning_type>	

### 15.19.3 Defined values

Parameter	Type	Description
<reporting>	Number	Configures the reporting of primary notification events: <ul style="list-style-type: none"> <li>• 0 (factory-programmed value): primary notification events disabled</li> <li>• 1: primary notification events enabled</li> </ul>
<message_identifier>	String	Hexadecimal character format. It contains the message identifier (2 bytes) of the primary notification
<serial_number>	String	Hexadecimal character format. It contains the serial number (2 bytes) of the primary notification
<warning_type>	String	Contains the warning type (2 bytes) of the primary notification.

## 15.20 Service center address +CSCA

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 10 s	+CMS Error

### 15.20.1 Description

Updates the SMSC address, through which mobile originated SMSes are transmitted. In text mode the setting is used by send and write commands. In PDU mode the setting is used by the same commands, but only when the length of SMSC address coded into <pdu> parameter equals zero.

- 👉 This command sets the service center value both in the RAM (this value is actually the SMSC address used) and in the SIM card. Through the read command the value of current service center stored in the RAM is displayed. At the power on, the MT reads the SMSC address in the SIM card and the same value is set in RAM.

## 15.20.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSCA=<sca>[,<tosca>]	OK	AT+CSCA="0170111000",129 OK
Read	AT+CSCA?	+CSCA: <sca>,<tosca> OK	+CSCA: " ",129 OK
Test	AT+CSCA=?	OK	

## 15.20.3 Defined values

Parameter	Type	Description
<sca>	String	Service center address
<tosca>	String	Type of address of <sca> (for more details refer to 3GPP TS 24.008 [12]); default 145 when string includes '+', otherwise default 129

## 15.21 Select cell broadcast message types +CSCB

+CSCB						
Modules	SARA-G300 SARA-G310 SARA-G340-00S SARA-G340-01S SARA-G350-00S SARA-G350-00X SARA-G350-01B SARA-G350-01S LEON-G LISA-U SARA-U TOBY-L200 TOBY-L201 TOBY-L210-00S TOBY-L210-02S TOBY-L210-50S TOBY-L210-60S TOBY-L220 TOBY-L280 MPCI-L2					
Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 10 s	+CMS Error

## 15.21.1 Description

Selects which types of CBM's are to be received by the MT.

## 15.21.2 Syntax

Type	Syntax	Response	Example
Set	AT+CSCB=[<mode>[,<mids>[,<dcss>]]]	OK	AT+CSCB=0,"1,5,10-11,40","" OK
Read	AT+CSCB?	+CSCB: <mode>,<mids>,<dcss> OK	+CSCB: 0," ", OK
Test	AT+CSCB=?	+CSCB: (list of supported <mode>s) OK	+CSCB: (0-1) OK

## 15.21.3 Defined values

Parameter	Type	Description
<mode>	Number	<ul style="list-style-type: none"> <li>• 0: message types specified in &lt;mids&gt; and &lt;dcss&gt; accepted</li> <li>• 1: message types specified in &lt;mids&gt; and &lt;dcss&gt; not accepted</li> </ul>
<mids>	String	Contains all possible combinations of CBM message identifiers (<mid>). See the 3GPP TS 23.041 [9], chapter 9.4. When RAT is UMTS up to 2048 message identifiers can be set; defining an exceeding combination will not cause an error result code and exceeding values will be ignored.
<dcss>	String	Contains all possible combinations of CBM data coding schemes (<dcs>). See the 3GPP TS 23.038 [7], chapter 5

#### 15.21.4 Notes

- If <mode>=0 and <mids> is an empty string, receiving of CB SMS is stopped.

#### TOBY-L2 / MPCI-L2

- The modules read on boot the files below from the USIM and they configure the CBM reception accordingly:
  - EF<sub>CBMID</sub> (Cell Broadcast Message Identifier for Data Download): this EF contains the message identifier parameters which specify the type of content of the cell broadcast messages which are to be passed to the USIM.
  - EF<sub>CBMI</sub> (Cell Broadcast Message identifier selection): this EF contains the Message Identifier Parameters which specify the type of content of the cell broadcast messages that the subscriber wishes the UE to accept.
  - EF<sub>CBMIR</sub> (Cell Broadcast Message Identifier Range selection): this EF contains ranges of cell broadcast message identifiers that the subscriber wishes the UE to accept.
- The maximum number of <mids> is 30.
- These commands perform these actions:
  - AT+CSCB=0 enables all the indications
  - AT+CSCB=1 disables all the indications
- To activate a custom range of mids perform the following actions:
  1. Power on the module, insert a valid SIM and insert its PIN (if needed).
  2. Read the current SIM configuration with AT+CSCB read command
  3. Modify the configuration by adding or removing some <mids> and/or <dcss> ranges.
  4. Enabling or disabling the reception of all <mids> and <dcss> will be stored in NVM, but not in SIM due to SIM data storage limitations.
  5. If the list must be modified after having enabled or disabled everything add or remove a <mids> or <dcss>, re-read the configuration with the AT+CSCB read command and then set it as needed.

#### LISA-U1

- When RAT is UMTS up to 1024 message identifiers can be set.

### 15.22 Read concatenated message +UCMGR

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min	+CMS Error

#### 15.22.1 Description

Returns the message with location value <index> from message storage <mem1> to the DTE and shows additional information when the message is a segment of a concatenated one.

- ☞ For SMS-DELIVER the parameters <tooa>, <fo>, <pid>, <dcs>, <sca>, <tosca>, <length> shall be displayed only if +CSDH=1 is set.
- ☞ For SMS-SUBMIT the parameters <toda>, <fo>, <pid>, <dcs>, <vp>, <sca>, <tosca>, <length> shall be displayed only if +CSDH=1 is set.
- ☞ For SMS-COMMAND <pid>, <mn>, <da>, <toda>, <length> <cdata> shall be displayed only if +CSDH=1 is set.
- ☞ The syntax AT+UCMGR=0 allows to display an SMS class 0 if it is signalized to MT, because no MMI is available in the MT (see also the note from command +CNMI, [Chapter 11.8](#)).
- ☞ If status of the received message is "received unread", status in the storage changes to "received read".
- ☞ The command is supported only for text mode (+CMGF=1).

 If the <index> value is out of range (it depends on the preferred message storage, +CPMS command, settings) or it refers to an empty position, then the "+CMS ERROR: invalid memory index" error result code is returned.

## 15.22.2 Syntax

Type	Syntax	Response	Example
Set	AT+UCMGR=<index>	<p>(SMS-DELIVER)</p> <p>+UCMGR: &lt;stat&gt;,&lt;oa&gt;,[&lt;alpha&gt;],&lt;scts&gt;[,&lt;tooa&gt;,&lt;fo&gt;,&lt;pid&gt;,&lt;dcs&gt;,&lt;sca&gt;,&lt;tosca&gt;,&lt;length&gt;][,&lt;seq&gt;,&lt;max&gt;,&lt;iei&gt;,&lt;ref&gt;]</p> <p>&lt;data&gt;</p> <p>OK</p> <p>(SMS-SUBMIT)</p> <p>+UCMGR: &lt;stat&gt;,&lt;da&gt;,[&lt;alpha&gt;]&lt;toda&gt;,&lt;fo&gt;,&lt;pid&gt;,&lt;dcs&gt;,[&lt;vp&gt;],&lt;sca&gt;,&lt;tosca&gt;,&lt;length&gt;][,&lt;seq&gt;,&lt;max&gt;,&lt;iei&gt;,&lt;ref&gt;]</p> <p>&lt;data&gt;</p> <p>OK</p> <p>(SMS-STATUS-report)</p> <p>+UCMGR:&lt;stat&gt;,&lt;fo&gt;,&lt;mrt&gt;,[&lt;ra&gt;],[&lt;tora&gt;]&lt;scts&gt;&lt;dt&gt;,&lt;st&gt;</p> <p>OK</p> <p>(SMS-COMMAND)</p> <p>+UCMGR: &lt;stat&gt;,&lt;fo&gt;,&lt;ct&gt;[,&lt;pid&gt;,&lt;mn&gt;],[&lt;da&gt;],[&lt;toda&gt;],&lt;length&gt;[&lt;cdata&gt;]]</p> <p>OK</p> <p>(CBM storage)</p> <p>+UCMGR: &lt;stat&gt;,&lt;sn&gt;,&lt;mid&gt;,&lt;dcs&gt;,&lt;page&gt;,&lt;pages&gt;</p> <p>&lt;data&gt;</p> <p>OK</p>	<p>AT+UCMGR=1</p> <p>+UCMGR: "REC READ", "393488535999", "07/04/05,18:02:28+08",145,4,0,0,"+393492000466",145,153,1,2,0,127</p> <p>u-blox reserves all rights to this document and the information contained herein. Reproduction, use or disclosure to third parties without express permis</p> <p>OK</p>
Test	AT+UCMGR=?	OK	

## 15.22.3 Defined values

Parameter	Type	Description
<index>	Number	Storage position
<stat>	String	Indicates the status of message in memory: <ul style="list-style-type: none"> <li>• "REC UNREAD": received unread SMS</li> <li>• "REC READ": received read SMS</li> <li>• "STO UNSENT": stored unsent SMS</li> <li>• "STO SENT": stored sent SMS</li> </ul>
<oa>	String	Originator address
<alpha>	String	Alphanumeric representation of <da> or <oa> corresponding to the entry found in the phonebook 3GPP TS 24.008 [12]. The parameter is not managed.
<scts>	String	Service center time stamp in time-string format, refer to <dt>
<tooa>	Number	Type of address of <oa> - octet
<fo>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 [8])
<pid>	Number	TP-Protocol-Identifier (default 0); refer to 3GPP TS 23.040 [8]
<dcs>	Number	Data Coding Scheme

Parameter	Type	Description										
<sca>	String	Service center address field										
<tosca>	Number	Type of address of <sca> - octet in Number format (for more details refer to 3GPP TS 24.008 [12]); default 145 when string includes '+', otherwise default 129										
<length>	Number	Number of characters										
<seq>	Number	Sequence number of the current short message (1-255)										
<max>	Number	Maximum number of short messages in the concatenated short message (1-255)										
<iei>	Number	Information Element Identifier, the possible values are the following: <ul style="list-style-type: none"> <li>• 0: Concatenated short messages, 8-bit reference number</li> <li>• 8: Concatenated short messages, 16-bit reference number</li> </ul>										
<ref>	Number	Concatenated short message reference number: <ul style="list-style-type: none"> <li>• 0-255: Concatenated short messages, 8-bit reference number case</li> <li>• 0-65535: Concatenated short messages, 16-bit reference number case</li> </ul>										
<data>	String	In the case of SMS: 3GPP TS 23.040 [8] TP-User-Data in text mode responses; format: <ul style="list-style-type: none"> <li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used and &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is not set:               <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command Select TE Character Set +CSCS Chapter 4.10): ME/TA converts GSM alphabet into current TE character set according to rules of 3GPP TS 27.005 [16] Annex A</li> <li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number (e.g. character TODO: what character should go here? (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))</li> </ul> </li> <li>• if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used, or &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))</li> </ul> In the case of CBS: 3GPP TS 23.041 [9] CBM Content of Message in text mode responses; format: <ul style="list-style-type: none"> <li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used:               <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command +CSCS chapter 26.15): ME/TA converts GSM alphabet into current TE character set according to rules of 3GPP TS 27.005 [16] Annex A</li> <li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number</li> </ul> </li> <li>• if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number</li> </ul>										
<da>	String	Destination address										
<toda>	Number	Type of address of <da> - octet										
<vp>	Number	Format depending of the <fo> setting: <ul style="list-style-type: none"> <li>• Relative format: validity period starting from when the SMS is received by the SMSC, in range 0-255 (default value 167); for more details refer to 3GPP TS 23.040 [8]</li> </ul> <table border="1"> <thead> <tr> <th>&lt;vp&gt;</th> <th>Validity period value</th> </tr> </thead> <tbody> <tr> <td>0 to 143</td> <td>(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)</td> </tr> <tr> <td>144 to 167</td> <td>12 hours + ((TP-VP - 143) x 30 minutes)</td> </tr> <tr> <td>168 to 196</td> <td>(TP-VP - 166) x 1 day</td> </tr> <tr> <td>197 to 255</td> <td>(TP-VP - 192) x 1 week</td> </tr> </tbody> </table> Absolute format: absolute time of the validity period termination in string format ("yy/MM/dd, hh:mm:ss+zz") (refer to 3GPP TS 23.040 [8]); the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56	<vp>	Validity period value	0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)	144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)	168 to 196	(TP-VP - 166) x 1 day	197 to 255	(TP-VP - 192) x 1 week
<vp>	Validity period value											
0 to 143	(TP-VP + 1) x 5 minutes (i.e. 5 minutes intervals up to 12 hours)											
144 to 167	12 hours + ((TP-VP - 143) x 30 minutes)											
168 to 196	(TP-VP - 166) x 1 day											
197 to 255	(TP-VP - 192) x 1 week											
<mr>	Number	Message reference										
<ra>	String	Recipient address field										
<tora>	Number	Type of address of <ra> - octet										
<scts>	String	Service center time stamp in time-string format, refer to <dt>										
<dt>	String	Discharge time in format "yy/MM/dd,hh:mm:ss+zz"; the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56										
<st>	Number	Status of an SMS STATUS-REPORT										

Parameter	Type	Description
<ct>	Number	TP-Command-Type (default 0)
<mn>	Number	3GPP TS 23.040 [8] TP-Message-Number in integer format
<mid>	Number	CBM message identifier
<cdata>	String	TP-Command-Data in text mode responses
<sn>	Number	CBM serial number
<page>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 4-7 in integer format
<pages>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 0-3 in integer format

## 15.23 List concatenated message +UCMGL

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min (<1 s for prompt ">" when present)	+CMS Error

### 15.23.1 Description

Returns SMS messages with status value <stat> from message storage <mem1> to the DTE and shows additional information when the message is a segment of a concatenated one.

- 👉 For SMS-DELIVER the parameters <tooa>, <length> shall be displayed only if +CSDH=1 is set.
- 👉 For SMS-SUBMIT the parameters <toda>, <length> shall be displayed only if +CSDH=1 is set.
- 👉 If status of the received message is "received unread", status in the storage changes to "received read".
- 👉 The command is supported only for text mode (+CMGF=1).

### 15.23.2 Syntax

Type	Syntax	Response	Example
Set	AT+UCMGL[=<stat>]	SMS-DELIVERS: +UCMGL: <index>,<stat>,<oa>,<alpha>,[<scts>][,<tooa>,<length>][,<seq>,<max>,<iei>,<ref>] <data> [+UCMGL: <index>,<stat>,<oa>,<alpha>,[<scts>][,<tooa>,<length>][,<seq>,<max>,<iei>,<ref>]<data>[...]] OK	AT+UCMGL +UCMGL: 304,"REC READ","+393401234999",,"08/08/06,10:01:38+08",145,152,1,2,8,32767 u-blox reserves all rights to this document and the information contained herein. Reproduction, use or disclosure to third parties without express permission is strictly prohibited.
		SMS-SUBMITS: +UCMGL: <index>,<stat>,<da>,<alpha>,[<toda>,<length>][,<seq>,<max>,<iei>,<ref>] <data> [+UCMGL: <index>,<stat>,<da>,<alpha>,[<toda>,<length>][,<seq>,<max>,<iei>,<ref>]<data>[...]] OK	+UCMGL: 305,"REC READ","+393401234999",,"08/08/06,10:01:40+08",145,29,2,2,8,32767
		SMS-STATUS-REPORTS:	OK

Type	Syntax	Response	Example
		+UCMGL: <index>,<stat>,<fo>,<mr>,<ra>,[<tora>],<scts>,<dt>,<st> [+UCMGL: <index>,<stat>,<fo>,<mr>,<ra>,[<tora>],<scts>,<dt>,<st> [...]] OK SMS-COMMANDS:	
		+UCMGL: <index>,<stat>,<fo>,<ct> [+UCMGL: <index>,<stat>,<fo>,<ct> [...]] OK CBM storage:	
		+UCMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages><data> [+UCMGL: <index>,<stat>,<sn>,<mid>,<page>,<pages>,<data> [...]] OK	
Test	AT+UCMGL=?	+UCMGL: (list of supported <stats>) OK	+UCMGL: ("REC UNREAD", "REC READ", "STO UNSENT", "STO SENT", "ALL ") OK

### 15.23.3 Defined values

Parameter	Type	Description
<stat>	String	Indicates the status of message in memory: <ul style="list-style-type: none"><li>• "REC UNREAD": received unread SMS messages</li><li>• "REC READ": received read SMS messages</li><li>• "STO UNSENT": stored unsent SMS messages</li><li>• "STO SENT": stored sent SMS messages</li><li>• "ALL": all SMS messages (default value)</li></ul>
<index>	Number	Storage position
<oa>	String	Originator address
<alpha>	String	Alphanumeric representation of <da> or <oa> corresponding to the entry found in the phonebook 3GPP TS 24.008 [12]. The parameter is not managed.
<scts>	String	Service center time stamp in time-string format; refer to <dt>
<tooa>	Number	Type of address of <oa> - octet
<length>	Number	Number of characters
<seq>	Number	Sequence number of the current short message (1-255)
<max>	Number	Maximum number of short messages in the concatenated short message (1-255)
<iei>	Number	Information Element Identifier, the possible values are the following: <ul style="list-style-type: none"><li>• 0: Concatenated short messages, 8-bit reference number</li><li>• 8: Concatenated short messages, 16-bit reference number</li></ul>
<ref>	Number	Concatenated short message reference number: <ul style="list-style-type: none"><li>• 0-255: Concatenated short messages, 8-bit reference number case</li><li>• 0-65535: Concatenated short messages, 16-bit reference number case</li></ul>
<data>	String	In the case of SMS: 3GPP TS 23.040 [8] TP-User-Data in text mode responses; format: <ul style="list-style-type: none"><li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used and &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is not set:<ul style="list-style-type: none"><li>◦ if TE character set other than "HEX" (refer command Select TE Character Set +CSCS chapter 26.15): ME/TA converts GSM alphabet into current TE character set according to rules of 3GPP TS 27.005 Annex A [16]</li><li>◦ if TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number (e.g. character TODO: what character should go here? (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))</li></ul></li><li>• if &lt;dcs&gt; indicates that 8-bit or UCS2 data coding scheme is used, or &lt;fo&gt; indicates that 3GPP TS 23.040 [8] TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two</li></ul>

Parameter	Type	Description
<da>	String	IRA character long hexadecimal number (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))
<toda>	Number	In the case of CBS: 3GPP TS 23.041 [9] CBM Content of Message in text mode responses; format:
<fo>	Number	<ul style="list-style-type: none"> <li>• if &lt;dcs&gt; indicates that 3GPP TS 23.038 [7] GSM 7 bit default alphabet is used:           <ul style="list-style-type: none"> <li>◦ if TE character set other than "HEX" (refer command +CSCS chapter 26.15): ME/TA converts GSM alphabet into current TE character set according to rules of 3GPP TS 27.005 [16]Annex A</li> </ul> </li> <li>• if TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number</li> </ul>
<mrt>	Number	if <dcs> indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number
<ra>	String	Destination address
<tora>	Number	Type of address of <ra> - octet
<mr>	Number	First octet of the SMS TPDU (see 3GPP TS 23.040 [8])
<mr>	Number	Message reference
<ra>	String	Recipient address field
<tora>	Number	Type of address of <ra> - octet
<dt>	String	Discharge time in format "yy/MM/dd,hh:mm:ss+zz"; the time zone is expressed in steps of 15 minutes. The range goes from -48 to +56
<st>	Number	Status of an SMS STATUS-REPORT
<ct>	Number	TP-Command-Type (default 0)
<sn>	Number	CBM serial number
<mid>	Number	CBM message identifier
<page>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 4-7 in integer format
<pages>	Number	3GPP TS 23.041 [9] CBM Page Parameter bits 0-3 in integer format
<dcs>	Number	Data Coding Scheme

## 15.24 Send concatenated message +UCMGS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	Up to 3 min (<1 s for prompt ">" when present)	+CMS Error

### 15.24.1 Description

Sends one segment of a concatenated message from a DTE to the network (SMS-SUBMIT). The message reference value <mr> is returned to the DTE for a successful message delivery. <Ctrl-Z> indicates that the SMS shall be sent, while <ESC> indicates aborting of the edited SMS.

- ☞ The command is supported only for text mode (+CMGF=1).
- ☞ The entered text is preceded by a ">" (Greater-Than sign) character, and this indicates that the interface is in "text enter" mode. The DCD signal shall be in ON state while the text is entered.

### 15.24.2 Syntax

Type	Syntax	Response	Example
Set	AT+UCMGS=<da>,[<toda>],<seq>,<max>,<iei>,<ref><CR> text is entered<Ctrl-Z/ESC>	+UCMGS: <mr> OK	AT+UCMGS="0171112233",1,2,0, 127<CR> > u-blox reserves all rights to this document and the information contained herein. Reproduction, use or disclosure to third parties without express permission<Ctrl- Z>

Type	Syntax	Response	Example
			+UCMGS:2 OK
	AT+UCMGS=?	OK	AT+UCMGS="0171112233",,2,2,0, 127<CR> > sion is strictly prohibited.<Ctrl-Z +UCMGS:3 OK
Test			

### 15.24.3 Defined values

Parameter	Type	Description
<da>	String	Destination address
<toda>	Number	Type of address of <da> - octet
<seq>	Number	Sequence number of the current short message (1-255)
<max>	Number	Maximum number of short messages in the concatenated short message (1-255)
<iei>	Number	Information Element Identifier, the possible values are the following: <ul style="list-style-type: none"> <li>• 0: Concatenated short messages, 8-bit reference number</li> <li>• 8: Concatenated short messages, 16-bit reference number</li> </ul>
<ref>	Number	Concatenated short message reference number: <ul style="list-style-type: none"> <li>• 0-255: Concatenated short messages, 8-bit reference number case</li> <li>• 0-65535: Concatenated short messages, 16-bit reference number case</li> </ul>
<text>	String	SMS String
<mr>	Number	Message reference

## 15.25 Write concatenated message to memory +UCMGW

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	< 10 s	+CMS Error

### 15.25.1 Description

Stores one segment of a concatenated message (SMS-DELIVER or SMS-SUBMIT) to memory storage <mem2> and returns the memory location <index> of the stored message. <Ctrl-Z> indicates that the SMS shall be stored, while <ESC> indicates aborting of the edited SMS.

 The command is supported only for text mode (+CMGF=1)

 The entered text is preceded by a ">" (Greater-Than sign) character, and this indicates that the interface is in "text enter" mode. The DCD signal shall be in ON state while the text is entered.

### 15.25.2 Syntax

Type	Syntax	Response	Example
Set	AT+UCMGW=[<oa/da>],[<tooa/toda>], [<stat>],<seq>,<max>,<iei>,<ref><CR> text is entered<Ctrl-Z/ESC>	+UCMGW: <index> OK	AT+UCMGW="091137880",,1,2,8, 32767<CR> > u-blox reserves all rights to thi document and the information contained herein. Reproduction, use or disclosure to third parties without express permi<Ctrl- Z> +UCMGW:302 OK

Type	Syntax	Response	Example
Set	AT+UCMGW="091137880",,2,2,8, 32767<CR>		> session is strictly prohibited.<Ctrl-Z +UCMGW:303
Test	AT+UCMGW=?	OK	OK

### 15.25.3 Defined values

Parameter	Type	Description
<da>	String	3GPP TS 23.040 [8] TP-Destination-Address Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set (refer command +CSCS in 3GPP TS 27.007 [2]); type of address given by <toda>
<oa>	String	3GPP TS 23.040 [8] TP-Originating-Address Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set (refer command +CSCS chapter Chapter 4.10); type of address given by <tooa>
<tooa>	Number	3GPP TS 24.011 [13] TP-Originating-Address Type-of-Address octet in integer format (default refer <toda>)
<toda>	Number	3GPP TS 24.011 [13] TP-Destination-Address Type-of-Address octet in integer format (when first character of <da> is + (IRA 43) default is 145, otherwise default is 129)
<stat>	String	Indicates the status of message in memory: <ul style="list-style-type: none"><li>• "REC UNREAD": received unread SMS messages</li><li>• "REC READ": received read SMS messages</li><li>• "STO UNSENT": stored unsent SMS messages</li><li>• "STO SENT": stored sent SMS messages (default value)</li></ul>
<seq>	Number	Sequence number of the current short message (1-255)
<max>	Number	Maximum number of short messages in the concatenated short message (1-255)
<iei>	Number	Information Element Identifier, the possible values are the following: <ul style="list-style-type: none"><li>• 0: Concatenated short messages, 8-bit reference number</li><li>• 8: Concatenated short messages, 16-bit reference number</li></ul>
<ref>	Number	Concatenated short message reference number: <ul style="list-style-type: none"><li>• 0-255: Concatenated short messages, 8-bit reference number case</li><li>• 0-65535: Concatenated short messages, 16-bit reference number case</li></ul>
<text>	String	SMS String
<index>	Number	Storage position

## 15.26 More messages to send +CMMS

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	-	+CMS Error

### 15.26.1 Description

Controls the continuity of SMS relay protocol link. When enabled, multiple SMS messages can be sent much faster as link is kept open.

### 15.26.2 Syntax

Type	Syntax	Response	Example
Set	AT+CMMS=[<mode>]	OK	AT+CMMS=2 OK
Read	AT+CMMS?	+CMMS: <mode> OK	+CMMS: 2 OK
Test	AT+CMMS=?	+CMMS: (list of supported <mode>s)	+CMMS: (0-2)

Type	Syntax	Response	Example
		OK	OK

### 15.26.3 Defined values

Parameter	Type	Description
<mode>	Number	<ul style="list-style-type: none"> <li>• 0 (default value): disabled</li> <li>• 1: keep enabled until the time between the response of the latest message send command (such as <a href="#">+CMGS</a>) and the next send command exceeds 5 s, then close the link and switch &lt;mode&gt; automatically back to 0</li> <li>• 2: keep permanently enabled. The link is closed after each send sequence, but &lt;mode&gt; is not switched back to 0</li> </ul>

## 15.27 Peek message +UCMGP

Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	Yes	No	No	<a href="#">Up to 3 min</a>	<a href="#">+CMS Error</a>

### 15.27.1 Description

Returns the message with location value <index> from message storage <mem1> to the DTE, the same as [+CMGR](#) does.

The SMS message is only 'peeked', i.e. its status is not forced to "received read SMS mode" after reading.

The syntax, defined values and remarks are the same as described for [+CMGR](#).

 The PIN verification is not required when the preferred memory storage is "ME".

### 15.27.2 Syntax

Type	Syntax	Response	Example
Set	<b>Text mode (+CMGF=1):</b> AT+UCMGP=<index>	<p><b>(SMS-DELIVER)</b></p> <p>+UCMGP: &lt;stat&gt;,&lt;oa&gt;,[&lt;alpha&gt;],&lt;scts&gt;[,&lt;tooa&gt;,&lt;fo&gt;,&lt;pid&gt;,&lt;dcs&gt;,&lt;sca&gt;,&lt;tosca&gt;,&lt;length&gt;]</p> <p>&lt;data&gt;</p> <p>OK</p> <p><b>(SMS-SUBMIT)</b></p> <p>+UCMGP: &lt;stat&gt;,&lt;da&gt;,[&lt;alpha&gt;][,&lt;toda&gt;,&lt;fo&gt;,&lt;pid&gt;,&lt;dcs&gt;,[&lt;vp&gt;],&lt;sca&gt;,&lt;tosca&gt;,&lt;length&gt;]</p> <p>&lt;data&gt;</p> <p>OK</p> <p><b>(SMS-STATUS-report)</b></p> <p>+UCMGP: &lt;stat&gt;,&lt;fo&gt;,&lt;cmr&gt;,[&lt;ra&gt;],[&lt;tora&gt;],&lt;scts&gt;,&lt;dt&gt;,&lt;st&gt;</p> <p>OK</p> <p><b>(SMS-COMMAND)</b></p> <p>+UCMGP: &lt;stat&gt;,&lt;fo&gt;,&lt;ct&gt;[,&lt;pid&gt;,&lt;mn&gt;],[&lt;da&gt;],[&lt;toda&gt;],&lt;length&gt;[&lt;cdata&gt;]]</p> <p>OK</p> <p><b>(CBM storage)</b></p>	<p>AT+UCMGP=303</p> <p>+UCMGP: "REC UNREAD", "+393488535999", "07/04/05,18:02:28+08",145,4,0,0,"+393492000466",145,93</p> <p>You have a missed called. Free information provided by your operator.</p> <p>OK</p>

Type	Syntax	Response	Example
		+UCMGP: <stat>,<sn>,<mid>,<dcs>,<page>,<pages>	
		<data>	
		OK	
<b>PDU mode (+CMGF=0):</b>		+UCMGP: <stat>,[<alpha>],<length>	AT+UCMGP=1
	AT+UCMGP=<index>	<pdu>	+UCMGP: 0,,40
		OK	0791934329002000040C9193230982
			661400008070328045218018D4F29CF
			E06B5CBF379F87C4EBF41E434082E7F
			DBC3
			OK
Test	AT+UCMGP=?	OK	

### 15.27.3 Defined values

Parameter	Type	Description
<index>	Number	Storage position

## 15.28 Message waiting indication +UMWI

+UMWI						
Modules	LISA-U200-01S LISA-U200-02S LISA-U200-03S LISA-U200-52S LISA-U200-62S LISA-U200-82S LISA-U200-83S LISA-U201 LISA-U230 LISA-U260 LISA-U270 SARA-U TOBY-L200-02S TOBY-L210-02S TOBY-L220 TOBY-L280-02S MPCI-L200-02S MPCI-L210-02S MPCI-L280					
Attributes	Syntax	PIN required	Settings saved	Can be aborted	Response time	Error reference
	full	No	No	No	-	+CME Error

### 15.28.1 Description

Provides information regarding the Message Waiting Indication (MWI) third level method (3GPP defined in 3GPP TS 23.040 [8]) and CPHS method [66] following AT&T Device Requirements [61].

The set command enables / disables the URC presentation. The URCs are by default enabled.

MWI is based on specific EFs not present in all SIM cards. In case these EFs are not present, the information text response is an error result code ("+CME ERROR: operation not allowed" if +CMEE is set to 2) and no URCs will be displayed.

 The URCs are displayed in groups of variable number which depends on the EFs present in the SIM card 3GPP TS 31.102 [19] and Common PCN Handset Specification [66].

### 15.28.2 Syntax

Type	Syntax	Response	Example
Set	AT+UMWI=<mode>	OK	AT+UMWI=1
			OK
Read	AT+UMWI?	+UMWI: <mode>,<status>,<type>[,<count>] [+UMWI: <mode>,<status>,<type>[,<count>][...]]	+UMWI: 1,0,1 +UMWI: 1,0,2 +UMWI: 1,1,3,255 +UMWI: 1,0,4
		OK	OK
Test	AT+UMWI=?	+UMWI: (list of supported <mode>s) OK	+UMWI: (0-1) OK
URC		+UMWI: <status>,<type>[,<count>] [+UMWI: <status>,<type>[,<count>]	+UMWI: 1,1,3 +UMWI: 1,2,5

Type	Syntax	Response	Example
		[...]]	+UMWI: 1,3,255 +UMWI: 0,4

### 15.28.3 Defined values

Parameter	Type	Description
<mode>	Number	Indicates whether the +UMWI URC is enabled or not: <ul style="list-style-type: none"> <li>• 0: disable the +UMWI URC</li> <li>• 1 (factory-programmed value): enable the +UMWI URC</li> </ul>
<status>	Number	Indicator the status for the respective <type>: <ul style="list-style-type: none"> <li>• 0: clear; no messages waiting</li> <li>• 1: set; messages waiting</li> </ul>
<type>	Number	Indicates the basic message indication type: <ul style="list-style-type: none"> <li>• 1: Voice Message Waiting (third level method) or Voice Message Waiting on Line 1 (CPHS method)</li> <li>• 2: Fax Message Waiting</li> <li>• 3: Electronic Mail Message Waiting</li> <li>• 4: Extended Message Type Waiting (i.e. see the 3GPP TS 23.038 <a href="#">[7]</a>)</li> <li>• 5: Video Message Waiting</li> <li>• 6: Voice Message Waiting on Line 2 (CPHS method)</li> <li>• 7: reserved for future use</li> </ul>
<count>	Number	Number of messages waiting for the respective <type>, range 1-255. 255 means that the number of waiting messages is unknown.

### 15.28.4 Notes

- If <status>=0, the <count> parameter is omitted.

## A Supported Error Codes

The +CME error codes availability is represented in the following tables:

M18Q2	M14A2A
Yes	Yes

Table A-1: Error codes supported for +CME

Error Code	Error Message
0	Phone failure
1	No connection to phone
2	Phone adaptor link reserved
3	Operation not allowed
4	Operation not supported
5	PH-SIM PIN required
6	PH-FSIM PIN required
7	PH-FSIM PUK required
10	SIM not inserted
11	SIM PIN required
12	SIM PUK required
13	SIM failure
15	SIM wrong
16	Incorrect password
17	SIM PIN2 required
18	SIM PUK2 required
20	Memory full
21	Invalid index
22	Not found
23	Memory failure
24	Text string too long
25	Invalid characters in text string
26	Dial string too long
27	Invalid characters in dial string

<b>30</b>	No network service
<b>31</b>	Network timeout
<b>32</b>	Network not allowed - emergency calls only
<b>40</b>	Network personalisation PIN required
<b>41</b>	Network personalisation PUK required
<b>42</b>	Network subset personalization PIN required
<b>43</b>	Network subset personalization PUK required
<b>44</b>	Network provider personalization PIN required
<b>45</b>	Service provider personalization PUK required
<b>46</b>	Corporate personalization PIN required
<b>47</b>	Corporate personalization PUK required
<b>49</b>	EAP method not supported
<b>50</b>	Incorrect parameters
<b>51</b>	Parameter length error for all Auth commands
<b>52</b>	Temporary error for all auth cmds
<b>100</b>	Unknown
<b>103</b>	Illegal Mem_Store
<b>106</b>	Illegal ME
<b>107</b>	GPRS services not allowed
<b>111</b>	PLMN not allowed
<b>112</b>	Location area not allowed
<b>113</b>	Roaming not allowed in this location area
<b>132</b>	Service option not supported
<b>133</b>	Requested service option not subscribed
<b>134</b>	Service option temporarily out of order
<b>148</b>	Unspecified GPRS error
<b>149</b>	PDP authentication failure
<b>150</b>	Invalid mobile class

## B Proprietary Error Codes

The proprietary error codes availability is represented in the table below:

M18Q2	M14A2A
Yes	No

The following table details the error codes supported only by @EXTERR for Internet Service commands.

Table B-1: Error codes supported for @EXTERR commands

Error Code	Error Message
512	Invalid argument(s) is(are) input.
513	Wrong argument numbers are input.
514	Out of memory.
515	Temporary failure.
516	System is busy.
517	Network error.
518	Invalid IP address is input.
519	Invalid domain name is input.
520	No response from the server.
521	Operation failure.
522	The specific GPIO is not supported.
523	I2C device address is not specified yet.
524	N/A
