1. Introduction

1.1 Overview

This document gives the usage of SIM52XX SSL functions; user can get useful information about the SIM52XX SSL functions quickly through this document.

The SSL functions are provided in AT command format, and they are designed for customers to design their HTTPS,FTPS and common SSL applications easily. User can access the SSL AT commands through UART/ USB interface which communicates with SIM52XX module.

SIM52XX SSL features:

- Basic HTTPS GET and POST operations.
- Basic FTPS LOGIN, LOGOUT, LIST, DEL, RMD, MKD, GET, PUT operations.
- Basic SSL socket operations.

1.2 References

The present document is based on the following documents:

SIMCOM_SIM5360_ATC_EN_V0.05.doc

1.3 Terms and Abbreviations

For the purposes of the present document, the following abbreviations apply:

- AT ATtention; the two-character abbreviation is used to start a command line to be sent from TE/DTE to TA/DCE
- EDGE Enhanced Data GSM Environment
- EGPRS Enhanced General Packet Radio Service
- FTPS File Transfer Protocol over Secure socket Layer
- GPRS General Packet Radio Service
- GSM Global System for Mobile communications
- HTTPS Hypertext Transfer Protocol over Secure Socket Layer
- PIN Personal Identification Number
- SSL Secure Socket Layer
- TA Terminal Adaptor; e.g. a data card (equal to DCE)
- TE Terminal Equipment; e.g. a computer (equal to DTE)
- UMTS Universal Mobile Telecommunications System
- URC Unsolicited Result Code
- USIM Universal Subscriber Identity Module

- WCDMA Wideband Code Division Multiple Access

2. HTTPS operations

The purpose of this section is to help get you start with HTTPS operations.

2.1 Acquire HTTPS stack

Each time when user needs to access a new HTTPS URL (AT+CHTTPSOPSE), the HTTPS stack needs to be acquired before the HTTPS operations:

```
AT+CHTTPSSTART
OK
```

2.2 Connect HTTPS server

After acquiring the HTTPS stack, user can connect the HTTPS server using the following AT command:

```
AT+CHTTPSOPSE="www.mywebsite.com", 443, 2
OK
```

The last parameter is the server type. Default is 2(HTTPS server). Following are the HTTPS server that supported:

- 1-HTTP server
- 2-HTTPS server with SSL3.0/TLS1.0 supported

2.3 Send HTTPS Request

After the HTTPS connection is established successfully. User can send HTTPS request data using the following AT commands:

```
AT+CHTTPSEND=88
>GET / HTTP/1.1
Host: www.mywebsite.com
User-Agent: MY WEB AGENT
Content-Length: 0
```

```
OK
```

When the HTTPS data is large (for example, posting a large file to server), the AT+CHTTPSEND can be used to send the data segmented to multiple parts:

AT+CHTTPSEND=1024

...

AT+CHTTPSEND=1024

...

When all the data has been sent, the AT+CHTTPSEND is used to commit these request data:

AT+CHTTPSEND

OK

...

+CHTTPSEND: 0

Also user can query how much data in the module cache is waiting to be sent:

AT+CHTTPSEND?

+CHTTPSEND: 1024

OK

2.4 Receive HTTPS response

After sending the HTTPS data, the HTTPS server may send HTTPS response to the module, and the module can use the following command to receive data from the server:

AT+CHTTPSRECV=1

OK

+CHTTPSRECV: DATA,249

HTTP/1.1 200 OK

Content-Type: text/html

Content-Language: zh-CN

Content-Length: 57

Date: Tue, 31 Mar 2009 01:56:05 GMT

Connection: Close

Proxy-Connection: Close

<html>

<header>test</header>

<body>

Test body

</body>

+CHTTPSRECV: 0

The parameter of this command is used to tell the module to receive the response data with at

least the length of the parameter.

If the response data is very large, user can use AT+CHTTPSRECV to receive the data multiple times.

2.5 Close HTTPS connection

User can close the HTTPS connection using AT+CHTTPSCLSE

```
AT+CHTTPSCLSE
```

```
OK
```

2.6 Release HTTPS stack

After closing HTTPS connection, user must release the HTTPS stack:

```
AT+CHTTPSSTOP
```

```
OK
```

2.7 Timer values of HTTPS operation

Following are the timer value setting for HTTPS operation:

| Timer | Value |
|-----------------------------|-----------|
| HTTPS connect | 2 minutes |
| HTTPS transferring timer | 2 minutes |
| HTTPS close | 2 minutes |
| HTTPS stop wireless network | 2minutes |

3. FTPS operations

3.1 Acquire FTPS stack

Each time when user needs to access a FTPS server, the FTPS stack needs to be acquired first:

```
AT+CFTPSSTART
```

```
OK
```

```
+CFTPSSTART: 0
```

3.2 Login the FTPS server

User can use the following AT command to login the FTPS server:

```
AT+CFTPSLOGIN="www.myftpsserver.com", 990, "myname", "mypassword",3
OK
+CFTPSLOGIN: 0
```

The last parameter of AT+CFTPSLOGIN is the type of FTP/FTPS server. Default is 3(implicit FTPS server). Following are the supported FTP/FTPS server type:

- 0-FTP server
- 1-explicit FTPS server with AUTH SSL supported
- 2-explicit FTPS server with AUTH TLS supported
- 3-implicit FTPS server with SSL3.0/TLS1.0 supported

3.3 Get Current directory on FTPS server

The following command can be used to get the current FTPS directory on server:

```
AT+CFTPSPWD
+CFTPSPWD: "/"
OK
```

3.4 Change Current directory on FTPS server

The following command can be used to change the current FTPS directory on server:

```
AT+CFTPSCWD= "/mysubdir"
OK
```

3.5 Create a new directory on FTPS server

The following command can be used to create a new directory on FTPS server:

```
AT+CFTPSMKD= "mynewdir"
OK
```

3.6 Remove a directory on FTPS server

The following command can be used to remove a directory on FTPS server:

```
AT+CFTPSRMD= "mynewdir"  
OK
```

Only when directory is empty, the directory can be removed successfully.

3.7 Delete a file on FTPS server

The following command can be used to delete a file on FTPS server:

```
AT+CFTPSDEL= "mydelfile"  
OK
```

3.8 Set FTPS transfer type

The following command can be used to set FTPS transfer type:

```
AT+CFTPSTYPE= I  
OK
```

3.9 List all items in current directory on FTPS server

The following command can be used to list all items in current directory on FTPS server:

```
AT+CFTPSLIST  
OK  
+CFTPSLIST: DATA,193  
drw-rw-rw-  1 user    group      0 Sep  1 18:01 .  
drw-rw-rw-  1 user    group      0 Sep  1 18:01 ..  
-rw-rw-rw-  1 user    group     2017 Sep  1 17:24 19800106_000128.jpg  
  
+CFTPSLIST: 0
```

3.10 Put a file from EFS to FTPS server

The following command can be used to put a file from EFS to FTPS server:

```
AT+CFTPSPUTFILE= 1, "myputfile.txt"  
OK  
+CFTPSPUTFILE: 0
```

3.11 Put a file from external MCU to FTPS server

The following command can be used to put a file from external MCU to FTPS server:

```
AT+CFTPSPUT= "myputfile.txt", 10  
>test content  
OK
```

When the file is large, user can use the following commands after the previous command to put the left data:

```
AT+CFTPSPUT=1024  
>...  
OK  
AT+CFTPSPUT=1024  
>...  
OK
```

After user has put all the data, the AT+CFTPSPUT should be used to put all the data:

```
AT+CFTPSPUT  
OK  
+CFTPSPUT: 0
```

Also user can use AT+CFTPSPUT? to query the size of the data in the module cache which needs to be sent:

```
AT+CFTPSPUT?  
+CFTPSPUT: 1024  
OK
```

3.12 Get a file from FTPS server to EFS

The following command can be used to get a file from FTPS server to EFS:

```
AT+CFTPGETFILE= 1, "mygetfile.txt"  
OK  
  
+CFTPGETFILE: 0
```

3.13 Get a file from FTPS server to external MCU

The following command can be used to get a file from FTPS server to external MCU:

```
AT+CFTPSGET= "myputfile.txt"  
OK  
+CFTPSGET: DATA, 1020,  
...  
+CFTPSGET: DATA, 1058,  
...  
...  
+CFTPSGET: 0
```

3.14 Logout the FTPS server

User can use the following AT command to logout the FTPS server:

```
AT+CFTPSLOGOUT  
OK  
+CFTPSLOGOUT: 0
```

3.15 Release the FTPS stack

User can use the following AT command to release FTPS stack:

```
AT+CFTPSSTOP  
OK  
+CFTPSSTOP: 0
```

3.16 Timer values of FTPS operation

Following are the timer value setting for FTPS operation:

| Timer | Value |
|-----------------------------|-----------|
| HTTPS connect | 2 minutes |
| HTTPS transferring timer | 2 minutes |
| HTTPS close | 2 minutes |
| HTTPS stop wireless network | 2minutes |

4. Common Channel operations

The purpose of this section is to help get you start with common SSL operations.

4.1 Set sending URC and receive data mode

The following command can be used to set sending result URC and receive data mode:

```
AT+CCHSET=0,0  
OK
```

The first parameter is the AT+CCHSEND URC report mode. If it is set to 1, after sending complete, the +CCHSEND: <session>,<result_code> will be reported.

The second parameter is the AT+CCHRECV mode. When it is 0, each received data packet will be reported as URC like +CCHRECV: DATA,<session_id>,<len>\r\n<data> directly. If the parameter is set to 1, whenever there is new data packet arrived, the +CCHEVENT: <session_id>,RECV EVENT URC will be reported, then MCU can use AT+CCHRECV=<session_id> to retrieve the received data.

4.2 Acquire Common Channel stack

The common channel stack needs to be acquired using the following AT command:

```
AT+CCHSTART  
OK  
+CCHSTART: 0
```

4.3 Open the channel

After acquiring the common channel stack, user can connect to peer using the following AT command:

```
AT+CCHOPEN=1, "www.mydomain.com", 443,2  
OK  
+CCHOPEN: 1, 0
```

The first parameter in all common channel related commands and unsolicited result code is the channel id. Currently only 0 and 1 are valid, which means there are maximum two sessions can be established at the same time.

The fourth parameter is the channel type, following are the supported channel types:

- 0-UDP
- 1-TCP client
- 2-SSL client with SSL3.0/TLS1.0 supported(default)

4.4 Send data

After the channel is opened successfully. User can send data using the following AT commands:

```
AT+CCCHSEND=1, 88  
>...0
```

OK

When the data is large, the AT+CCCHSEND can be used to send for multiple times:

```
AT+CCCHSEND=1, 1024  
>...  
AT+CCCHSEND=1, 1024  
>...
```

When AT+CCCHSET=1 is set, the +CCCHSEND URC will be report after sending:

```
+CCCHSEND: 1, 0
```

Also user can query how much data in the module cache is waiting to be sent:

```
AT+CCCHSEND?  
+CCCHSEND: 0, 0, 1, 1024  
OK
```

4.5 Receive data

When the second parameter of AT+CCCHSET is 0, whenever there is data arrived, the following unsolicited code may be reported:

```
+CCHRECV: DATA, 1, 1024  
.....
```

When the second parameter of AT+CCCHSET is 1, whenever there is data arrived, the following unsolicited code may be reported:

```
+CCHEVENT: 1, RECV EVENT
```

The MCU can use AT+CCHRECV=1 to retrieve the cached received data

4.6 Close the channel

User can close the SSL connection using AT+CSSLCLOSE

```
AT+CCHCLOSE = 1
OK
+CCHCLOSE: 1, 0
```

4.7 Release the stack

After closing all the opened channels, user must release the common channel stack:

```
AT+CCHSTOP
OK
+CCHSTOP: 0
```

4.8 Using Transparent Mode for Common Channel Service

Currently only session 0 can be used for transparent mode. If user needs to use transparent mode for common channel AT commands, the following AT command needs to be executed:

```
AT+CCHMODE=1
OK
```

After running this command, the AT+CCHOPEN command will run like following:

```
AT+CCHMODE=1
OK
AT+CCHSTART
OK
AT+CCHOPEN=0,"www.myserver.com",443
CONNECT 115200
.....
```

When the "CONNECT 115200" is reported, the current serial port is running in SSL transparent mode, all the data put into the port will be transferred to the peer part transparently, and all the data received from the peer part will be output through the serial port. If the UART or USB MODEM port is used to run this command, the "+++", DTR signal and ATO command can be used to switch the serial port mode between "ONLINE DATA" AND "ONLINE COMMAND".

4.9 Timer values of Channel operation

Following are the timer value setting for SSL operation:

| Timer | Value |
|------------------------------|-----------|
| Open channel | 2 minutes |
| Waiting sendable state | 2 minutes |
| Channel close | 2 minutes |
| Release common channel stack | 2minutes |

5. Unsolicited Result Code

5.1 Unsolicited result code of HTTPS

| Code | Description |
|---------------------|--|
| +CHTTPS: RECV EVENT | When the AT+CHTTPSRECV is not being called, and there is data cached in the receiving buffer, this event will be reported. |

5.2 Unsolicited result code of common channel

Following is the unsolicited result code of +CCHRECV URC,

| Code of <level> | Description |
|--|---|
| +CCHRECV: DATA, <session_id>,<len>\r\n<data> > | The session_id is the index of the channel. The len is the length of the data. |

6. Certificate & Key Management

The purpose of this section is to help get you start with common SSL certificate & key management. Currently only .der and raw .pem format files without password protection can be used.

6.1 Download certificate & key files to the module

The following command can be used to download certificate & key files to the module:

```
AT+CCERTDOWN="mycert.der", 753
>file content...
OK
```

Following is the sample source code for calling AT+CCERTDOWN:

certdownloader_src.rar

6.2 List all certificate & key files in the module

The following command can be used to list all the certificate & key files which has been downloaded into the module:

```
AT+CCERTLIST
+CCERTLIST: "ca_cert.der"
+CCERTLIST: "client_cert.der"
+CCERTLIST: "client_key.der"
+CCERTLIST: "server_cert.pem"
+CCERTLIST: "server_key.pem"

OK
```

6.3 Delete a certificate or key file in the module

The following command can be delete a certificate & key file which has been downloaded into the module:

```
AT+CCERTDELETE=" server_key.pem"
OK
```

6.4 Set the CA file

The following command can be used to set the CA file for current SSL operation, This command can only be used after AT+CHTTPSSTART/AT+CCHSTART/AT+CFTPSSTART:

```
AT+CCERTCA=0,"ca.pem"  
OK
```

6.5 Set the certificate file

The following command can be used to set the certificate file for current SSL operation, This command can only be used after AT+CHTTPSSTART/AT+CCHSTART/AT+CFTPSSTART:

```
AT+CCERTCERT="my_cert.pem",0  
OK
```

6.6 Set the key file

The following command can be used to set the key file for current SSL operation, This command can only be used after AT+CHTTPSSTART/AT+CCHSTART/AT+CFTPSSTART:

```
AT+CCERTKEY=0,"my_key.pem"  
OK
```

6.7 Load the CA/certificate/key files

The following command can be used to load the CA/certificate/key files set using AT+CSSLCA/AT+CSSLCERT/AT+CSSLKEY for current SSL operation, This command can only be used after AT+CHTTPSSTART/AT+CCHSTART/AT+CFTPSSTART:

```
AT+CSSLLOADCK  
OK
```

7. AT Command Samples

7.1 AT Command Samples of HTTPS

| AT commands | Comments |
|---|--|
| AT+CHTTPSSTART OK | Acquire the HTTPS stack |
| AT+CHTTPSOPSE="www.mywebsite.com",443 OK | Connect the HTTPS server |
| AT+CHTTPSENDD=88 >GET / HTTP/1.1 | Send the HTTPS request data. If the request is large, this AT+CHTTPSENDD=<len> |

| | |
|---|---|
| Host: www.mywebsite.com User-Agent: MY WEB AGENT Content-Length: 0 OK | command can be used multiple times. |
| AT+CHTTPSEND | Commit all the data which has been sent previously using AT+CHTTPSEND=<len> |
| AT+CHTTPSRECV=1 OK +CHTTPSRECV: DATA,249 HTTP/1.1 200 OK Content-Type: text/html Content-Language: zh-CN Content-Length: 57 Date: Tue, 31 Mar 2009 01:56:05 GMT Connection: Close Proxy-Connection: Close <html> <header>test</header> <body> Test body </body> +CHTTPSRECV: 0 | Receive the HTTPS response from the HTTPS server. If the response data is large, this AT+CHTTPSRECV=<len> command can be used multiple times. |
| AT+CHTTPSCLSE OK | Close the HTTPS connection |
| AT+CHTTPSSTOP OK | Release the HTTPS stack |

7.2 AT Command Samples of FTPS

| AT commands | Comments |
|--|--|
| AT+CFTPSSTART OK +CFTPSSTART: 0 | Acquire the FTPS stack |
| AT+CFTPSLOGIN="www.myftpsserver.com",990 , "myname", "mypassword" OK +CFTPSLOGIN: 0 | Login the FTPS server |
| AT+CFTPSMKD="testdir" | Create a directory under the current directory |

| | |
|---|---|
| OK | on FTPS |
| AT+CFTPSRMD="testdir" | Remove a directory from the current directory on FTPS server |
| AT+CFTPSDEL="testdelfile.txt" | Delete a file on the FTPS server |
| OK | |
| AT+CFTPSCWD="/mysubdir" | Change current directory to "/mysubdir" on FTPS server |
| OK | |
| AT+CFTPSPWD +CFTPSPWD:"/mysubdir" | Get the current directory on FTPS server |
| OK | |
| AT+CFTPSTYPE=I | Set the FTPS transferring type to binary |
| AT+CFTPSLIST +CFTPSLIST: DATA,193 drw-rw-rw- 1 user group 0 Sep 1 18:01 . drw-rw-rw- 1 user group 0 Sep 1 18:01 .. -rw-rw-rw- 1 user group 2017 Sep 1 17:24 19800106_000128.jpg +CFTPSLIST: 0 | List the items under the current directory on FTPS server |
| AT+CFTPSGETFILE=1, "testfile.jpg" | Get the "testfile.jpg" from server to local EFS C:\Picture directory |
| OK +CFTPSGETFILE: 0 | |
| AT+CFTPSPUTFILE=1, "testfile.jpg" | Put the local C:\Picture\testfile.jpg to the current directory on FTPS server |
| OK +CFTPSPUTFILE: 0 | |
| AT+CFTPSGET="testfile.jpg" | Get the "testfile.jpg" under current FTPS directory to external MCU. |
| OK +CFTPSGET: DATA, 1024, ... +CFTPSGET:DATA, 1058 ... +CFTPSGET: 0 | |
| AT+CFTPSPUT="t1.txt",11 >test content OK AT+CFTPSPUT=18 >left data put here OK AT+CFTPSPUT OK +CFTPSPUT: 0 | Put a file of "t1.txt" from external MCU to the current directory on FTPS server. |

| | |
|---|------------------------|
| AT+CFTPSLOGOUT OK +CFTPSLOGOUT: 0 | Logout the FTPS server |
| AT+CFTPSSTOP OK +CFTPSSTOP: 0 | Release the FTPS stack |

7.3 AT Command Samples of Common Channel

| AT commands | Comments |
|---|--|
| AT+CCHSET=1 OK | Enable reporting +CHSEND result |
| AT+CCHSTART OK +CCHSTART: 0 | Acquire the common channel stack |
| AT+CCHOPEN=1, "www.myserver.com",443 OK | Connect the server |
| AT+CCHSEND=1, 88 >GET / HTTP/1.1 Host: www.mywebsite.com User-Agent: MY WEB AGENT Content-Length: 0 OK +CCHSEND: 1, 0 | Send the data. If the request is large, this AT+CCHSEND=1, <len> command can be used multiple times. |
| +CCHRECV: DATA, 1, 249 HTTP/1.1 200 OK Content-Type: text/html Content-Language: zh-CN Content-Length: 57 Date: Tue, 31 Mar 2009 01:56:05 GMT Connection: Close Proxy-Connection: Close <html> <header>test</header> <body> Test body </body> | Receive the data sent from the peer. |
| AT+CCHCLOSE=1 OK | Close the channel |

| | |
|-------------------|-------------------|
| AT+CCHLSTOP OK | Release the stack |
|-------------------|-------------------|

7.4 AT Command Samples of HTTPS supporting cert/key

| AT commands | Comments |
|--|---|
| AT+CHTTPSSTART OK | Acquire the HTTPS stack |
| AT+CSSLCA=0,"ca_cert.der" OK | Set the CA |
| AT+CSSLCERT="client_cert.der",0 OK | Set the client certificate |
| AT+CSSLKEY="client_key.der" OK | Set the client key |
| AT+CSSLLOADCK OK | Load the CA/certificate/key files |
| AT+CHTTPSOPSE="www.mywebsite.com",443 OK | Connect the HTTPS server |
| AT+CHTTPSEND=88 >GET / HTTP/1.1 Host: www.mywebsite.com User-Agent: MY WEB AGENT Content-Length: 0 OK | Send the HTTPS request data. If the request is large, this AT+CHTTPSEND=<len> command can be used multiple times. |
| AT+CHTTPSEND | Commit all the data which has been sent previously using AT+CHTTPSEND=<len> |
| AT+CHTTPSRECV=1 OK +CHTTPSRECV: DATA,249 HTTP/1.1 200 OK Content-Type: text/html Content-Language: zh-CN Content-Length: 57 Date: Tue, 31 Mar 2009 01:56:05 GMT Connection: Close Proxy-Connection: Close <html> | Receive the HTTPS response from the HTTPS server. If the response data is large, this AT+CHTTPSRECV=<len> command can be used multiple times. |

| | |
|---|----------------------------|
| <pre><header>test</header> <body> Test body </body> +CHTTPSRECV: 0</pre> | |
| <pre>AT+CHTTPSCLSE OK</pre> | Close the HTTPS connection |
| <pre>AT+CHTTPSSTOP OK</pre> | Release the HTTPS stack |
